LV8415CB — Blurring correction driver IC for DSC H bridge × 2ch driver

Overview

LV8415CB is blurring correction driver IC for DSC.

Functions

- Actuator driver (saturation drive H bridge) × 2ch
- Constant current hall bias circuit × 2ch
- With built-in for PWM signal generation logic circuit × 2ch
- 8bitDAC for hall amplifier offset adjustment × 2ch
- Two systems in power supply (V_M: for actuator, V_{CC})
- With built-in low voltage malfunction prevention circuit
- Hall Amplifier × 2ch
- General-purpose amplifier × 2ch
- 8bitDAC for hall bias × 2ch
- Three line serial input
- With built-in thermal protection circuit

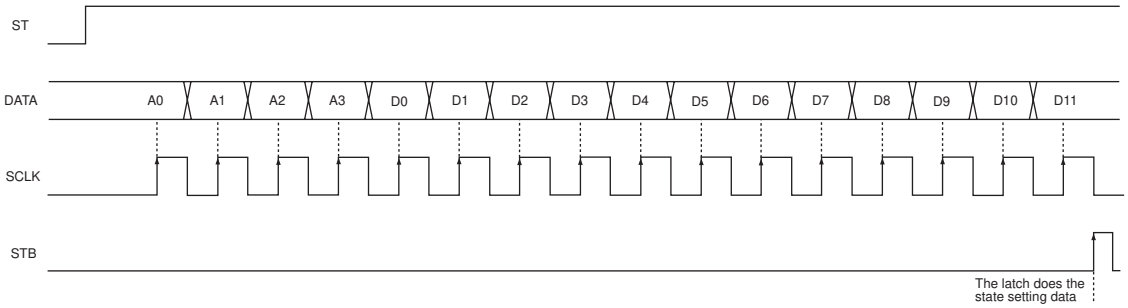
Serial data timing condition

Serial data input timing chart



It inputs it from A0 in order of D11. The data transfer is done by the rising edge, and after all data transfers, the latch does all data to SCLK by the STB signal standing up. The STB signal accepts and the internal logic of IC doesn't accept the SCLK signal during "H".

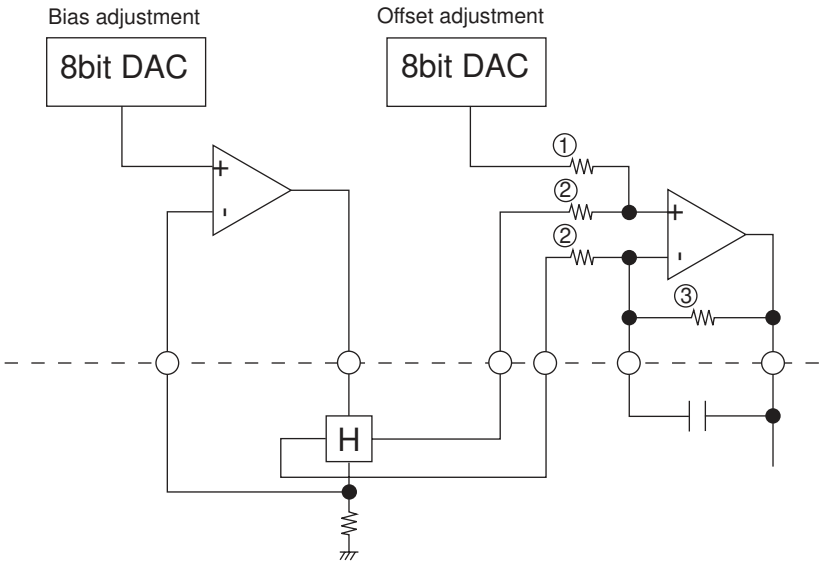
Note : External CLK mode is for the shipment inspection. Use it with internal CLK. Use it after it internal CLK switches because default is external CLK mode.

Hall bias, Offset adjustment circuit configuration



Hall amplifier, Hall bias equivalent circuit

About the gain adjustment

The resistance ratio of "2" and "3" is adjusted in figure and the gain is set. Refer to the setting to the cereal map. The magnification can be set from ten by 200.

About the Offset adjustment

The resistance ratio of "1" and "2" is adjusted in figure and the Offset is set. Refer to the setting to the cereal map. The magnification can be set from ten by 200.

Note in design

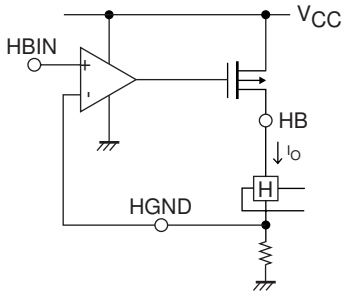
• Stand-by function

IC becomes a stand-by state at ST = “L”, and IC enters the state of operation at ST =”H”. Moreover, the register in IC is reset as for ST = “L” at times.

• Hall bias

The constant current output is built into for the hall element drive. The constant current value is set from detection resistance (RHG) connected from the HBIN pin impression voltage and the HGND pin between GND.

Constant current value (I_O) = HBIN voltage ÷ Detection resistance



Constant current value (I_O) becomes about 1mA when assuming HBIN pin impressed voltage =1.0V and detection resistance = 1 kΩ from the above-mentioned calculation type. Moreover, the HGND pin must connect with the HB pin, and connect the detection resistance of a large value as much as possible when you do not use the hall bias circuit.

• Operation amplifier

Impress the bias to the V_{IN}+ pin, and compose the buffer by the connection to the VOUT pin in the V_{IN}- pin in the operational amplifier not used.
