**Product Description**

The PI6C2502A features a low-skew, low-jitter, phase-locked loop (PLL) clock driver. By connecting the feedback FB\_OUT output to the feedback FB\_IN input, the propagation delay from the CLK\_IN input to any clock output will be nearly zero.

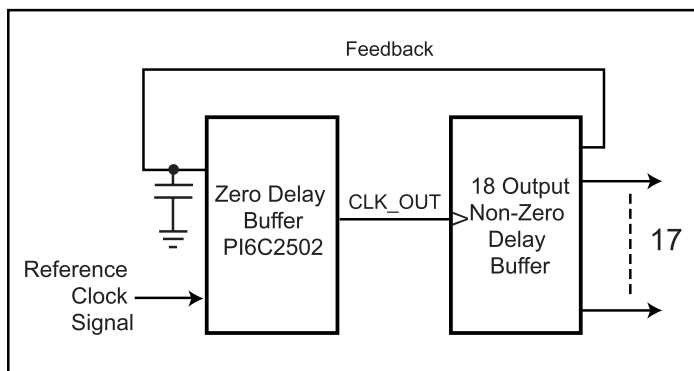

**Application**

If a system designer needs more than 16 outputs with the features just described, using two or more zero-delay buffers such as PI6C2509Q, and PI6C2510Q, is likely to be impractical. The device-to-device skew introduced can significantly reduce the performance. Pericom recommends the use of a zero-delay buffer and an eighteen output non-zero-delay buffer. As shown in Figure 1, this combination produces a zero-delay buffer with all the signal characteristics of the original zero-delay buffer, but with as many outputs as the non-zero-delay buffer part. For example, when combined with an eighteen output non-zero delay buffer, a system designer can create a seventeen-output zero-delay buffer.

### Pin Functions

Pin Name	Pin Number	Type	Description
CLK_IN	8	I	Reference Clock input. CLK_IN allows spread spectrum clock input.
FB_IN	5	I	Feedback input. FB_IN provides the feedback signal to the internal PLL.
FB_OUT	2	O	Feedback output FB_OUT is dedicated for external feedback. FB_OUT has an embedded series-damping resistor of the same value as the clock outputs CLK_OUT.
CLK_OUT	3	O	Clock outputs. These outputs provide low-skew copies of CLK_IN. Each output has an embedded series-damping resistor.
AV <sub>CC</sub>	7	Power	Analog power supply. AV <sub>CC</sub> can be also used to bypass the PLL for test purposes. When AV <sub>CC</sub> is strapped to ground, PLL is bypassed and CLK_IN is buffered directly to the device outputs.
AGND	1	Ground	Analog ground. AGND provides the ground reference for the analog circuitry.
V <sub>CC</sub>	4	Power	Power supply.
GND	6	Ground	Ground.
