The diagram shows a yellow rectangular DC-DC converter. On the left side, there are two input pins labeled '+Vin' (top) and '-Vin' (bottom). On the right side, there are two output pins labeled '+Vout' (top) and '-Vout' (bottom). A fuse is connected in series with the +Vin pin. The word 'DC-DC CONVERTER' is written in blue on the yellow box. The word 'INPUT' is written above the input pins, and 'OUTPUT' is written above the output pins.

Note: Certain applications may require the installation of external fuse in front of the input.

KAW-EL SERIES APPLICATION NOTES:

EXTERNAL CAPACITANCE REQUIREMENTS:

No external capacitance is required for operation of the KAW-EL series.

To meet the reflected ripple requirements of the converter, an input impedance of less than 0.5 ohm from DC to 220 KHz is required.

External output capacitance is not required for operation; however it is recommended that 10uF tantalum and 0.1uF ceramic capacitance be selected for reduced system noise.

Additional output capacitance may be added for increased filtering, but should not exceed 2200uF.

We Can Offer EMC-Filter According To EN55011/22 Class B.

Negative Outputs:

A negative output voltage may be obtained by connecting the +OUT to circuit ground and connecting -OUT as the negative output.

Remote ON/OFF:

The remote ON/OFF pin may be left floating if this function is not use. It is recommended to drive this pin with an open collector arrangement or a relay contact. When the ON/OFF pin is pulled low with respect to the -VIN, the converter is placed in a low power drain state.

Output TRIM:

The TRIM pin may be used to adjust the output +/-10% from the nominal setting .this function allows adjustment for voltage drops in the system wiring. If the TRIM function is not required the pin may be left floating.
