# SN54ABTH25245, SN74ABTH25245 25- $\Omega$ OCTAL BUS TRANSCEIVERS WITH 3-STATE OUTPUTS

SCBS251F - JUNE 1992 - REVISED MAY 1997

- State-of-the-Art *EPIC-*II*B*<sup>™</sup> BiCMOS Design Significantly Reduces Power Dissipation
- ESD Protection Exceeds 2000 V Per MIL-STD-883, Method 3015; Exceeds 200 V Using Machine Model (C = 200 pF, R = 0)
- Latch-Up Performance Exceeds 500 mA Per JEDEC Standard JESD-17
- Typical V<sub>OLP</sub> (Output Ground Bounce) < 1 V at V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25°C
- High-Impedance State During Power Up and Power Down
- Designed to Facilitate Incident-Wave Switching for Line Impedances of 25 Ω or Greater
- Distributed V<sub>CC</sub> and GND Pin Configuration Minimizes High-Speed Switching Noise
- Bus Hold on Data Inputs Eliminates the Need for External Pullup/Pulldown Resistors
- Package Options Include Plastic Small-Outline (DW) Package, Ceramic Chip Carriers (FK), and Standard Plastic (NT) and Ceramic (JT) DIPs

#### description

The 'ABTH25245 are  $25 \cdot \Omega$  octal bus transceivers designed for asynchronous communication between data buses. They improve both the performance and density of 3-state memory address drivers, clock drivers, and bus-oriented transceivers.

These devices allow noninverted data transmission from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable ( $\overline{OE}$ ) input can disable the device so that both buses are effectively isolated. When  $\overline{OE}$  is low, the device is active.

These transceivers are capable of sinking 188 mA of  $I_{OL}$  current, which facilitates switching 25- $\Omega$  transmission lines on the incident wave. The distributed  $V_{CC}$  and GND pins minimize switching noise for more-reliable system operation.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

#### description (continued)

When  $V_{CC}$  is between 0 and 2.1 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 2.1 V,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The SN54ABTH25245 is characterized for operation over the full military temperature range of  $-55^{\circ}$ C to  $125^{\circ}$ C. The SN74ABTH25245 is characterized for operation from  $-40^{\circ}$ C to  $85^{\circ}$ C.

#### logic symbol<sup>†</sup>

<sup>†</sup> This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12. Pin numbers shown are for the DW, JT, and NT packages.

#### logic diagram (positive logic)

**To Seven Other Channels** 

Pin numbers shown are for the DW, JT, and NT packages.

#### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

| Supply voltage range, V <sub>CC</sub>   |
|---|
| Input voltage range, V <sub>I</sub> (except I/O ports) (see Note 1) –0.5 V to 7 V |
| Voltage range applied to any output in the disabled or power-off state, $V_O$     |
| Voltage range applied to any output in the high state, V <sub>O</sub> $\ldots$    |
| Input clamp current, I <sub>IK</sub> (V <sub>I</sub> < 0)                         |
| Output clamp current, I <sub>OK</sub> (V <sub>O</sub> < 0)                        |
| Current into any output in the low state, I <sub>O</sub> : SN74ABTH25245 (A port) |
| SN74ABTH25245 (B port) 128 mA   |
| Package thermal impedance, θ <sub>JA</sub> (see Note 2): DW package               |
| NT package  |
| Storage temperature range, T <sub>stg</sub>                                       |

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

2. The package thermal impedance is calculated in accordance with EIA/JEDEC Std JESD51, except for through-hole packages, which use a trace length of zero.

| Cio                      | A or B ports   | V <sub>CC</sub> = 5 V,  | $V_{O} = V_{CC}$ or GND                 |      | 11.5  |       |      | 11.5   |       | pF   |

\* On products compliant to MIL-PRF-38535, this parameter does not apply.

<sup>†</sup> All typical values are at  $V_{CC} = 5 \text{ V}$ ,  $T_A = 25^{\circ}\text{C}$ .

<sup>‡</sup> This parameter is characterized, but not production tested.

§ Not more than one output should be tested at a time, and the duration of the test should not exceed one second.

This is the increase in supply current for each input that is at the specified TTL voltage level rather than V<sub>CC</sub> or GND.

#### PARAMETER MEASUREMENT INFORMATION

NOTES: A. CL includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR  $\leq$  10 MHz, Z<sub>O</sub> = 50  $\Omega$ , t<sub>f</sub>  $\leq$  2.5 ns, t<sub>f</sub>  $\leq$  2.5 ns.
- D. The outputs are measured one at a time with one transition per measurement.
