3-A, 3.3/5-V INPUT ADJUSTABLE SWITCHING REGULATOR

FEATURES

- **Up to 3-A Output Current at 85°C**
- **3.3-V / 5-V Input Voltage**
- **Wide-Output Voltage Adjust (0.9 V to 3.6 V)**
- **160 W/in^3 Power Density**
- **Efficiencies Up To 94%**
- **On/Off Inhibit**
- **Undervoltage Lockout (UVLO)**
- **Output Overcurrent Protection (Nonlatching, Auto-Reset)**
- **Overtemperature Protection**
- **Ambient Temp. Range: –40°C to 85°C**
- **Surface Mount Package**
- **Safety Agency Approvals: UL/IEC/CSA-C22.2 60950-1**

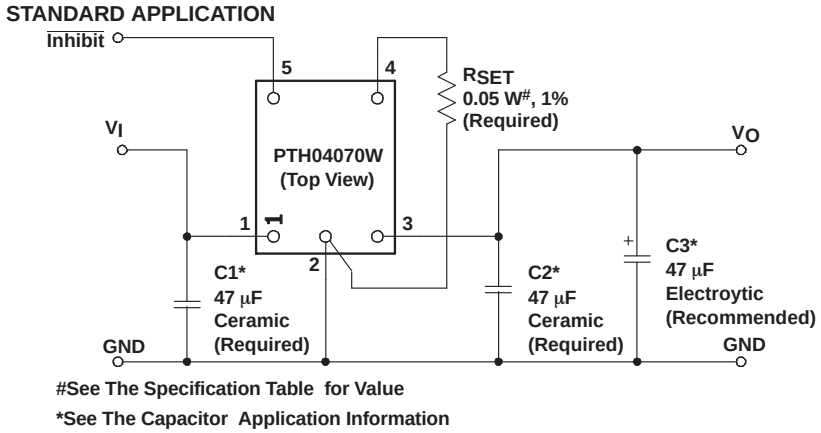
APPLICATIONS

- **Telecommunications, Instumentation, and General-Purpose Circuits**

DESCRIPTION

The PTH04070W is a highly integrated, low-cost switching regulator module that delivers up to 3 A of output current. Occupying less PCB area than a standard TO-220 linear regulator IC, the PTH04070W provides output current at a much higher efficiency and with much less power dissipation, thereby eliminating the need for a heat sink. Their small size (0.5 × 0.4 in), high efficiency, and low cost makes these modules attractive for a variety of applications.

The input voltage range of the PTH04070W is from 3 V to 5.5 V, allowing operation from either a 3.3-V or 5-V input bus. Using state-of-the-art switched-mode power-conversion technology, the PTH04070W can step down to voltages as low as 0.9 V from a 5-V input bus, with typically less than 1 W of power dissipation. The output voltage can be adjusted to any voltage over the range, 0.9 V to 3.6 V, using a single external resistor. Operating features include an undervoltage lockout (UVLO), on/off inhibit, output overcurrent protection, and overtemperature protection. Target applications include telecommunications, test and measurement applications, and high-end consumer products. The modules are available in both through-hole and surface-mount package options, including tape and reel.



These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted(1)

				PTH04070	UNIT
T_A	Operating free-air temperature	Over V_I range		-40 to 85	°C
T_{wave}	Wave solder temperature	Surface temperature of module body or pins (5 seconds maximum)	Suffix AH & AD	260	
T_{reflow}	Solder reflow temperature	Surface temperature of module body or pins	Suffix AS	235(2)	
			Suffix AZ	260(2)	
T_{stg}	Storage temperature			-55 to 125(3)	

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) During reflow of surface mount package version do not elevate peak temperature of the module, pins or internal components above the stated maximum.
(3) The shipping tray or tape and reel cannot be used to bake parts at temperatures higher than 65°C.

RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT
V_I	Input voltage	3	5.5	V
T_A	Operating free-air temperature	–40	85	°C

PACKAGE SPECIFICATIONS

PTH04070WXX		
Weight		1.5 grams
Flammability	Meets UL 94 V-O	
Mechanical shock	Per Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted	500 G (1)
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz	20 G (1)

(1) Qualification limit.

ELECTRICAL CHARACTERISTICS

at 25C free-air temperature, V_I = 5 V, V_O = 3.3 V, I_O = I_O(Max), C1 = 47 µF, C2 = 47 µF (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_O	Output current	T_A = 85°C, natural convection airflow	0		3	A

F_S	Switching frequency	Over V_I and I_O ranges		700		kHz
	External input capacitance	Ceramic type (C1)	47 (4)			µF
	External output capacitance	Ceramic type (C2)	47 (5)		200	µF
		Nonceramic type (C3)		47 (5)	560 (6)	
		Equivalent series resistance (nonceramic)	4 (7)			mΩ
MTBF	Calculated reliability	Per Bellcore TR-332, 50% stress, T_A = 40°C, ground benign	48			10^6 Hrs

(1) The set-point voltage tolerance is affected by the tolerance and stability of R_{SET}. The stated limit is unconditionally met if R_{SET} has a tolerance of 1% with with 100 ppm/°C or better temperature stability.
(2) The minimum input voltage is 3 V or (V_O + 1.1) V, whichever is greater. A 5-V input bus is recommended for output voltages higher than 2 V.
(3) This control pin has an internal pullup to the input voltage V_I. If it is left open circuit, the module operates when input power is applied. A small low-leakage (<100 nA) MOSFET is recommended for control. Do not tie the inhibit pin to V_I or to another module's inhibit pin. See the application section for further guidance.
(4) An external 47-µF ceramic capacitor is required across the input (V_I and GND) for proper operation. Locate the capacitor close to the module.
(5) An external 47-µF ceramic capacitor is required across the output (V_O and GND) for proper operation. Locate the capacitor close to the module. Adding another 47 µF of electrolytic capacitance close to the load improves the response of the regulator to load transients.
(6) This is the calculated maximum capacitance. The minimum ESR limitation often results in a lower value. See the capacitor application information for further guidance.
(7) This is the typical ESR for all the electrolytic (nonceramic) capacitance. Use 7 mΩ as the minimum when calculating the total equivalent series resistance (ESR) using the max-ESR values specified by the capacitor manufacturer.

PIN ASSIGNMENT

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
V_I	1	I	The positive input voltage power node to the module, which is referenced to common GND.
GND	2		This is the common ground connection for the V_I and V_O power connections. It is also the 0 VDC reference for the *Inhibit* and V_O *Adjust* control inputs.
V_O	3	O	The regulated positive power output with respect to the GND node.
V_OAdjust	4	I	A 1% resistor must be connected between this pin and GND (pin 1) to set the output voltage of the module higher than 0.9 V. If left open-circuit, the output voltage defaults to this value. The temperature stability of the resistor should be 100 ppm/°C (or better). The set-point range is from 0.9 V to 3.6 V. The electrical specification table gives the standard resistor value for a number of common output voltages. Refer to the application information for further guidance.
Inhibit	5	I	The Inhibit pin is an open-collector/drain-negative logic input that is referenced to GND. Applying a low-level ground signal to this input disables the module's output. When the Inhibit control is active, the input current drawn by the regulator is significantly reduced. If the Inhibit pin is left open-circuit, the module will produce an output voltage whenever a valid input source is applied.

APPLICATION INFORMATION

Adjusting the Output Voltage of the PTH04070W Wide-Output Adjust Power Modules

The *V_OAdjust* control (pin 4) sets the output voltage of the PTH04070W product. The adjustment range is from 0.9 V to 3.6 V. The adjustment method requires the addition of a single external resistor, R_{SET}, that must be connected directly between the *V_OAdjust* and *GND* pin 2. Table 1 gives the standard external resistor for a number of common bus voltages, along with the actual voltage the resistance produces.

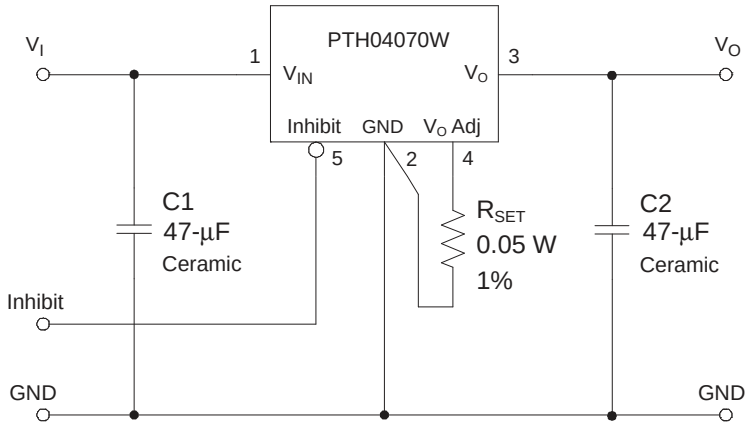
For other output voltages, the value of the required resistor can either be calculated using the following formula, or simply selected from the range of values given in Table 2. Figure 9 shows the placement of the required resistor.

$$R_{set} = 10\ k\Omega \times \frac{0.891\ V}{V_{out} - 0.9\ V} - 3.24\ k\Omega$$

Table 1. Standard Values of R_{set} for Common Output Voltages

V_O (V) (Required)	R_{SET} (kΩ) (Standard Value)	V_O(V) (Actual)
3.3(1)	0.475	3.298
2.5(1)	2.32	2.502
2	4.87	1.999
1.8	6.65	1.801
1.5	11.5	1.504
1.2	26.1	1.204
1	84.5	1.001
0.9	Open	0.9

(1) The minimum input voltage is 3 V or (V_O + 1.1) V, whichever is greater.



(1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 4 and 2 using dedicated PCB traces.

(2) Never connect capacitors from *V_OAdjust* to either *GND* or *V_O*. Any capacitance added to the *V_OAdjust* pin will affect the stability of the regulator.

CAPACITOR RECOMMENDATIONS for the PTH04070W WIDE-OUTPUT ADJUST POWER MODULES

Input Capacitor

The minimum recommended input capacitor(s) is 47-µF of ceramic capacitance, in either an X5R or X7R temperature tolerance. The ceramic capacitors should be located within 0.5 in. (1,27 cm) of the regulator's input pins. Electrolytic capacitors can also be used at the input, but only in addition to the required ceramic capacitance. The minimum ripple current rating for nonceramic capacitors should be at least 200 mA rms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input.

When specifying regular tantalum capacitors for use at the input, a minimum voltage rating of 2 × (maximum dc voltage + ac ripple) is highly recommended. This is standard practice to ensure reliability. Polymer-tantalum capacitors are not affected by this requirement.

For improved ripple reduction on the input bus, additional ceramic capacitors can be used to complement the minimum requirement.

Output Capacitors

For most applications only one (1) 47-µF ceramic capacitor is required. The ceramic capacitor should be located within 0.5 in. (1,27 cm) of the output pin. Adding a second 47-µF nonceramic capacitor allows the module to meet its transient response specification. For applications with load transients (sudden changes in load current), the regulator response benefits from additional external output capacitance. A high-quality computer-grade electrolytic capacitor should be adequate.

Electrolytic capacitors should be located close to the load circuit. These capacitors provide decoupling over the frequency range, 2 kHz to 150 kHz. Aluminum electrolytic capacitors are suitable for ambient temperatures above 0°C. For operation below 0°C, tantalum or OS-CON type capacitors are recommended. When using one or more nonceramic capacitors, the calculated equivalent ESR should be no lower than 4 mΩ (7 mΩ using the manufacturer's maximum ESR for a single capacitor). A list of preferred low-ESR type capacitors are identified in Table 3, the recommended capacitor table.

Ceramic Capacitors

Above 150 kHz the performance of aluminum electrolytic capacitors becomes less effective. To further improve the reflected input ripple current, or the output transient response, multilayer ceramic capacitors must be added. Ceramic capacitors have very low ESR and their resonant frequency is higher than the bandwidth of the regulator. When placed at the output their combined ESR is not critical as long as the total value of ceramic capacitance does not exceed 200 µF. Also, to prevent the formation of local resonances, do not place more than three identical ceramic capacitors with values of 10 µF or greater in parallel.

Tantalum Capacitors

Additional tantalum type capacitors can be used at both the input and output, and are recommended for applications where the ambient operating temperature can be less than 0°C. The AVX TPS, Sprague 593D/594/595 and Kemet T495/T510/T520 capacitors series are suggested over many other tantalum types due to their rated surge, power dissipation, and ripple current capability. As a caution, many general-purpose tantalum capacitors have considerably higher ESR, reduced power dissipation, and lower ripple current capability. These capacitors are also less reliable as they have lower power dissipation and surge current ratings. Tantalum capacitors that do not have a stated ESR or surge current rating are not recommended for power applications. When specifying OS-CON and polymer tantalum capacitors for the output, the minimum ESR limit is encountered well before the maximum capacitance value is reached.

Capacitor Table

The capacitor table, Table 3, identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The recommended number of capacitors required at both the input and output buses is identified for each capacitor type. This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The rms rating and ESR (at 100 kHz) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.

Designing for Load Transients

The transient response of the dc/dc converter has been characterized using a load transient with a di/dt of 1 A/µs. The typical voltage deviation for this load transient is given in the data sheet specification table using the optional value of output capacitance. As the di/dt of a transient is increased, the response of a converter's regulation circuit ultimately depends on its output capacitor decoupling network. This is an inherent limitation with any dc/dc converter once the speed of the transient exceeds its bandwidth capability. If the target application specifies a higher di/dt or lower voltage deviation, the requirement can only be met with additional output capacitor decoupling. In these cases, special attention must be paid to the type, value, and ESR of the capacitors selected.

If the transient performance requirements exceed those specified in the data sheet, the selection of output capacitors becomes more important. Review the minimum ESR in the characteristic data sheet for details on the capacitance maximum.

(1) A ceramic capacitor is required on both the input and the output. An electrolytic capacitor can be added to the output for improved transient response.
(2) An optional through-hole capacitor available.
(3) A total capacitance of 44 µF is an acceptable replacement for a single 47-µF capacitor.

Power-Up Characteristics

When configured per the standard application, the PTH04070W power module produces a regulated output voltage following the application of a valid input source voltage. During power up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay (typically 10 ms) into the power-up characteristic. This is from the point that a valid input source is recognized. Figure 10 shows the power-up waveforms for a PTH04070W, operating from a 3-V input and with the output voltage adjusted to 1.8 V. The waveforms were measured with a 2-A resistive load.

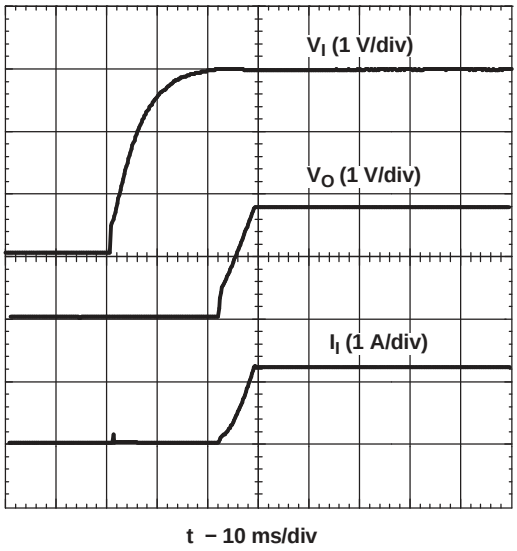

Figure 10. Power-Up Waveforms

Current Limit Protection

The PTH04070W modules protect against load faults with a continuous current limit characteristic. Under a load fault condition, the output current cannot exceed the current limit value. Attempting to draw current that exceeds the current limit value causes the output voltage to be progressively reduced. Current is continuously supplied to the fault until it is removed. Upon removal of the fault, the output voltage will promptly recover.

Thermal Shutdown

Thermal shutdown protects the module internal circuitry against excessively high temperatures. A rise in temperature may be the result of a drop in airflow, a high ambient temperature, or a sustained current limit condition. If the junction temperature of the internal components exceeds 150°C, the module shuts down. This reduces the output voltage to zero. The module will start up automatically, by initiating a soft-start power up when the sensed temperature decreases 10°C below the thermal shutdown trip point.

Output On/Off Inhibit

For applications requiring output voltage on/off control, the PTH04070W power module incorporates an output on/off Inhibit control (pin 5). The inhibit feature can be used wherever there is a requirement for the output voltage from the regulator to be turned off.

The power module functions normally when the Inhibit pin is left open-circuit, providing a regulated output whenever a valid source voltage is connected to Vin with respect to GND.

Figure 11 shows the typical application of the inhibit function. Note the discrete transistor (Q1). The Inhibit control has its own internal pullup to V_I potential. An open-collector or open-drain device is recommended to control this input.

Turning Q1 on applies a low voltage to the *Inhibit* control pin and disables the output of the module. If Q1 is then turned off, the module will execute a soft-start power-up sequence. A regulated output voltage is produced within 20 msec. Figure 12 shows the typical rise in the output voltage, following the turn off of Q1. The turn off of Q1 corresponds to the fall in the waveform, Q1 Vgs. The waveforms were measured with a 2-A resistive load.

PTH04070WAH	ACTIVE	Through-Hole Module	EVD	5	90	RoHS Exempt & Green	SN	N / A for Pkg Type	-40 to 85		Samples
PTH04070WAS	ACTIVE	Surface Mount Module	EVE	5	90	Non-RoHS & Green	SNPB	Level-1-235C-UNLIM/ Level-3-260C-168HRS	-40 to 85		Samples
PTH04070WAST	ACTIVE	Surface Mount Module	EVE	5	250	Non-RoHS & Green	SNPB	Level-1-235C-UNLIM/ Level-3-260C-168HRS	-40 to 85		Samples
PTH04070WAZ	ACTIVE	Surface Mount Module	EVE	5	90	RoHS Exempt & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85		Samples
PTH04070WAZT	ACTIVE	Surface Mount Module	EVE	5	250	RoHS Exempt & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

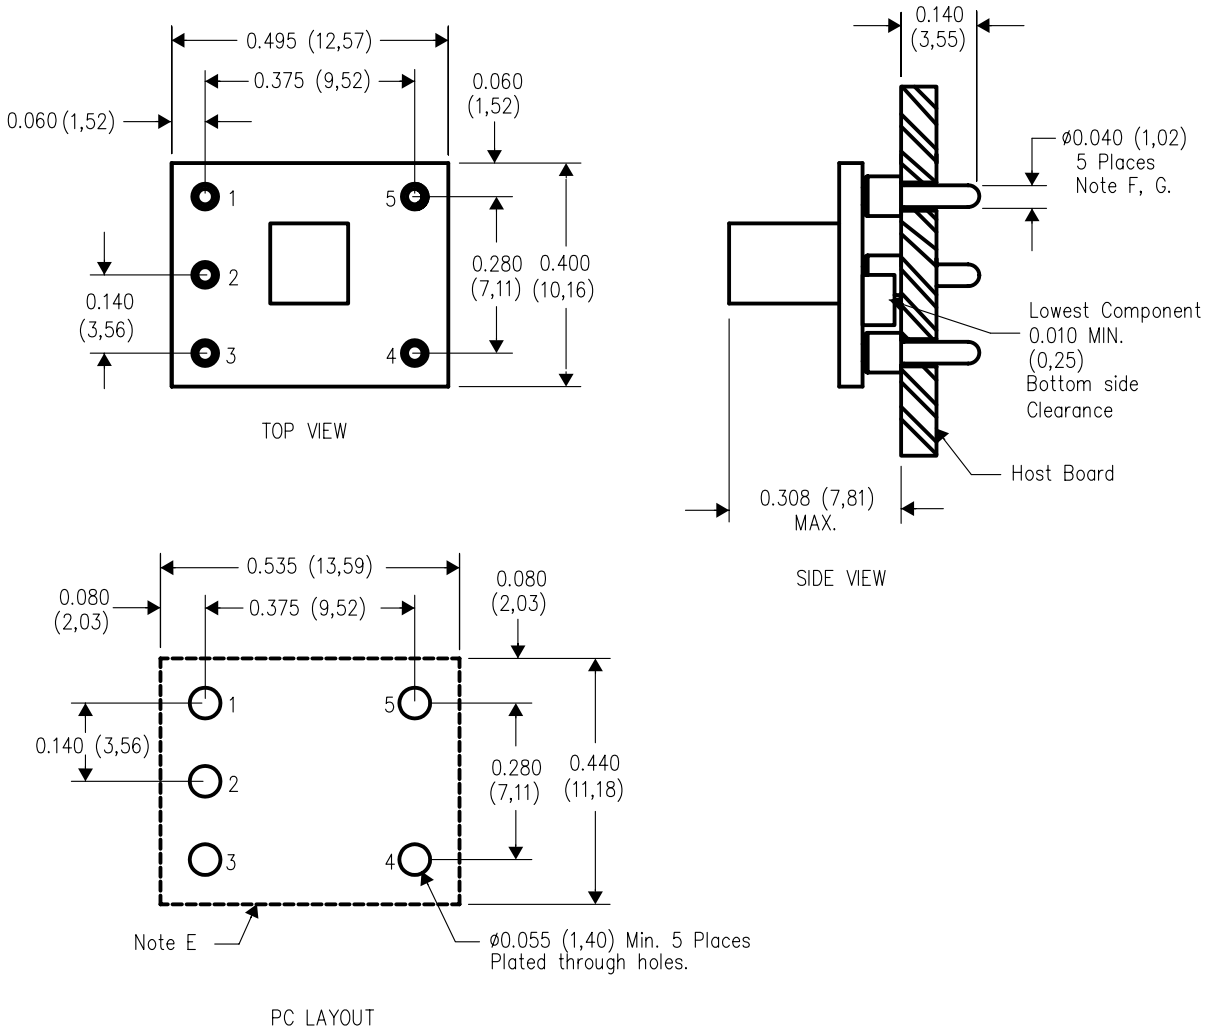
(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

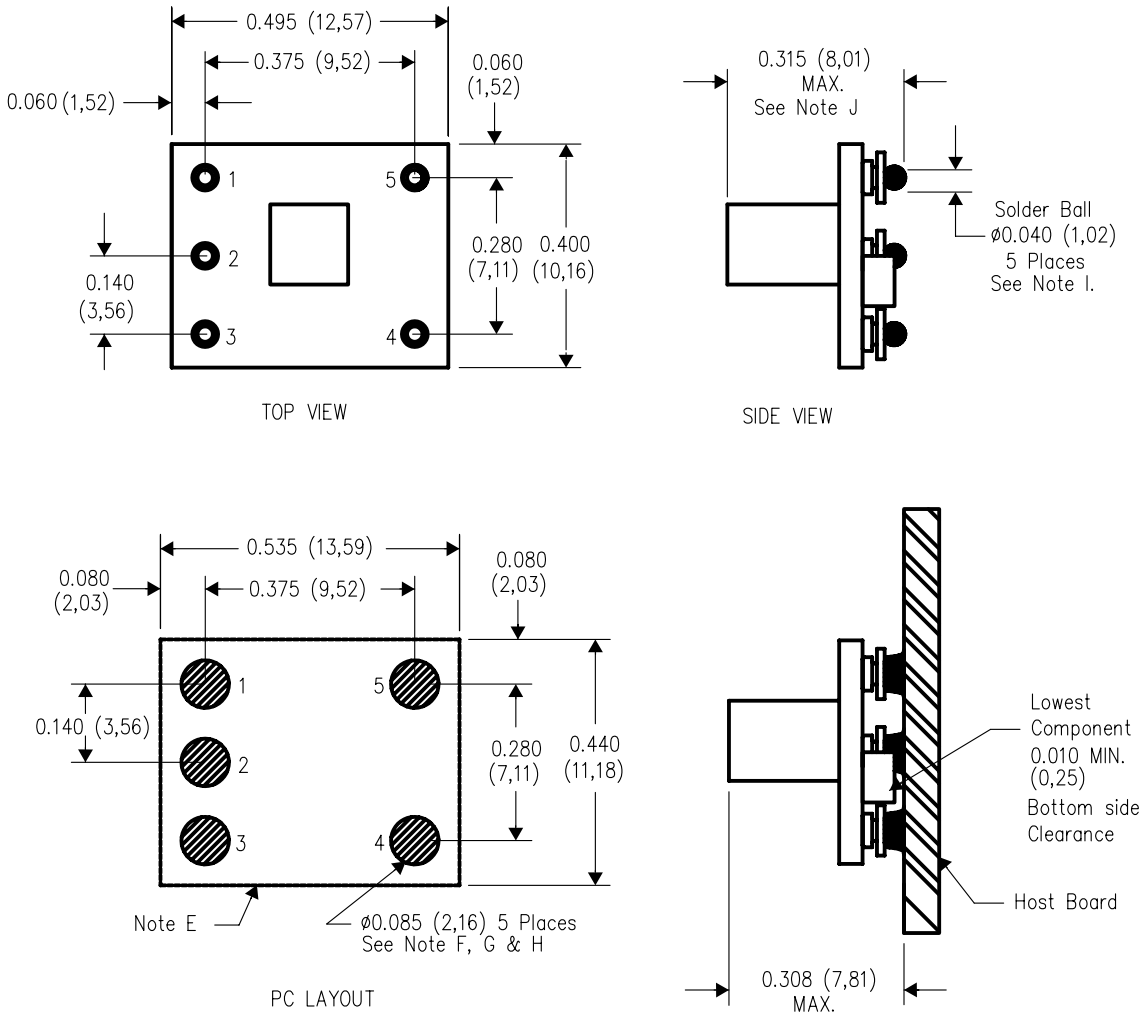
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

EVD (R–PDSS–T5) DOUBLE SIDED MODULE



NOTES:
A. All linear dimensions are in inches (mm).
B. This drawing is subject to change without notice.
C. 2 place decimals are ±0.030 (±0,76mm).
D. 3 place decimals are ±0.010 (±0,25mm).
E. Recommended keep out area for user components.
F. Pins are 0.040" (1,02) diameter with 0.070" (1,78) diameter standoff shoulder.
G. All pins: Material – Copper Alloy
Finish – Tin (100%) over Nickel plate

EVE (R–PDSS–T5) DOUBLE SIDED MODULE



4206289/A 08/04

NOTES:
A. All linear dimensions are in inches (mm).
B. This drawing is subject to change without notice.
C. 2 place decimals are ±0.030 (±0,76mm).
D. 3 place decimals are ±0.010 (±0,25mm).
E. Recommended keep out area for user components.
F. Power pin connection should utilize two or more vias to the interior power plane of 0.025 (0,63) I.D. per input, ground and output pin (or the electrical equivalent).
G. Paste screen opening: 0.080 (2,03) to 0.085 (2,16). Paste screen thickness: 0.006 (0,15).
H. Pad type: Solder mask defined.
I. All pins: Material – Copper Alloy
Finish – Tin (100%) over Nickel plate
Solder Ball – See product data sheet.
J. Dimension prior to reflow solder.

IMPORTANT NOTICE AND DISCLAIMER
