

## 74VCX16838

### Low Voltage 16-Bit Selectable Register/Buffer with 3.6V Tolerant Inputs and Outputs

#### General Description

The VCX16838 contains sixteen non-inverting selectable buffered or registered paths. The device can be configured to operate in a registered, or flow through buffer mode by utilizing the register enable (REGE) and Clock (CLK) signals. The device operates in a 16-bit word wide mode. All outputs can be placed into 3-State through use of the  $\overline{OE}$  Pin. These devices are ideally suited for buffered or registered 168 pin and 200 pin SDRAM DIMM memory modules.

The 74VCX16838 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O compatibility up to 3.6V.

The 74VCX16838 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

**Functional Description**

The 74VCX16838 consists of sixteen selectable non-inverting buffers or registers with word wide modes. Mode functionality is selected through operation of the CLK and REGE pin as shown by the truth table. When REGE is held at a logic HIGH the device operates as a 16-bit register. Data is transferred from I<sub>n</sub> to O<sub>n</sub> on the rising edge of the CLK input. When the REGE pin is held at a logic LOW the device operates in a flow through mode and data propagates directly from the I to the O outputs. All outputs can be 3-STATE by holding the OE pin at a logic HIGH.
