

# SLG59M1709V

## An Ultra-small, 4 mΩ, 4 A Load Switch with Multiple Protection Features

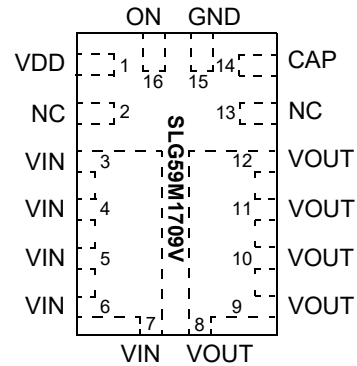

### General Description

Operating from a 2.5 V to 5.5 V power supply and fully specified over the -40 °C to 85 °C temperature range, the SLG59M1709V is a high-performance 4 mΩ, 4 A single-channel nFET load switch with adjustable inrush current control which is achieved by adjusting the V<sub>OUT</sub> slew rate with an external capacitor. Using a proprietary MOSFET design, the SLG59M1709V achieves a stable 4 mΩ RDS<sub>ON</sub> across a wide input/supply voltage range. Incorporating two-stage current protection as well as thermal protection, the SLG59M1709V is designed for all 0.8 V to 5.5 V power rail applications. The SLG59M1709V is packaged in a space-efficient, low thermal resistance, RoHS-compliant 1.6 mm x 2.5 mm STQFN package

### Features

- Low Typical RDS<sub>ON</sub> nFET: 4 mΩ
- Maximum Continuous Switch Current: Up to 4 A
- Supply Voltage: 2.5 V ≤ V<sub>DD</sub> ≤ 5.5 V
- Wide Input Voltage Range: 0.8 V ≤ V<sub>IN</sub> ≤ V<sub>DD</sub>
- Capacitor-adjustable Start-up and Inrush Current Control
- Two-stage Overcurrent Protection:
  - Fixed threshold, 8 A Active Current Limit
  - Fixed 0.5 A Short-circuit Current Limit
- Operating Temperature: -40 °C to 85 °C
- Low θ<sub>JA</sub>, 16-pin 1.6 mm x 2.5 mm STQFN Packaging
- Pb-Free / Halogen-Free / RoHS compliant

### Pin Configuration

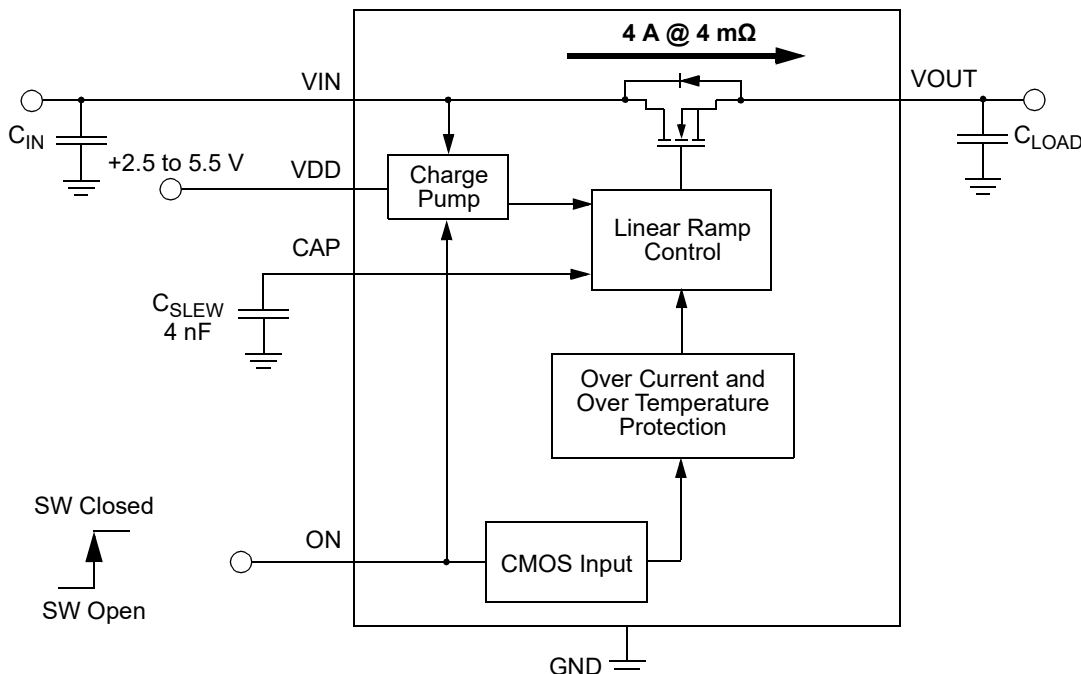

**16-pin FC-STQFN**  
(Top View)

### Applications

- Notebook Power Rail Switching
- Tablet Power Rail Switching
- Smartphone Power Rail Switching

### Block Diagram

## SLG59M1709V

An Ultra-small, 4 mΩ, 4 A Load Switch  
with Multiple Protection Features

### Pin Description

Pin #	Pin Name	Type	Pin Description
1	VDD	Power	With an internal 1.9 V $V_{DD(UVLO)}$ threshold, VDD supplies the power for the operation of the load switch and internal control circuitry where its range is $2.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ . Bypass the VDD pin to GND with a 0.1 $\mu\text{F}$ (or larger) capacitor
2	NC	NC	No Connect
3-7	VIN	MOSFET	Drain terminal of Power MOSFET (Pins 3-7 fused together). Connect a 10 $\mu\text{F}$ (or larger) low ESR capacitor from this pin to GND. Capacitors used at VIN should be rated at 10 V or higher.
8-12	VOUT	MOSFET	Source terminal of Power MOSFET (Pins 8-12 fused together). Connect a low ESR capacitor (up to 500 $\mu\text{F}$ ) from this pin to GND. Capacitors used at VOUT should be rated at 10 V or higher.
13	NC	NC	No Connect
14	CAP	Input	A low-ESR, stable dielectric, ceramic surface-mount capacitor connected from CAP pin to GND sets the $V_{OUT}$ slew rate and overall turn-on time of the SLG59M1709V. For best performance, the range for $C_{SLEW}$ values are $2\text{ nF} \leq C_{SLEW} \leq 22\text{ nF}$ . Capacitors used at the CAP pin should be rated at 10 V or higher.
15	GND	GND	Ground
16	ON	Input	A low-to-high transition on this pin closes the load switch. ON is an asserted-HIGH, level-sensitive CMOS input with $ON_{V_{IL}} < 0.3\text{ V}$ and $ON_{V_{IH}} > 0.85\text{ V}$ . While there is an internal pull down circuit to ground ( $\sim 4\text{ M}\Omega$ ), connect this pin to the output of a general-purpose output (GPO) from a microcontroller or other application processor.

### Ordering Information

Part Number	Type	Production Flow
SLG59M1709V	STQFN 16L	Industrial, -40 °C to 85 °C
SLG59M1709VTR	STQFN 16L (Tape and Reel)	Industrial, -40 °C to 85 °C

#### SLG59M1709V Power-Up/Power-Down Sequence Considerations

To ensure glitch-free power-up under all conditions, apply  $V_{DD}$  first, followed by  $V_{IN}$  after  $V_{DD}$  exceeds 1.9 V. Then allow  $V_{IN}$  to reach 90% of its max value before toggling the ON pin from Low-to-High. Likewise, power-down in reverse order.

If  $V_{DD}$  and  $V_{IN}$  need to be powered up simultaneously, glitching can be minimized by having a suitable load capacitor. A 10  $\mu\text{F}$   $C_{LOAD}$  will prevent glitches for rise times of  $V_{DD}$  and  $V_{IN}$  higher than 2 ms.

If the ON pin is toggled HIGH before  $V_{DD}$  and  $V_{IN}$  have reached their steady-state values, the load switch timing parameters may differ from datasheet specifications.

The slew rate of output  $V_{OUT}$  follows a linear ramp set by a capacitor connected to the CAP pin. A larger capacitor value at the CAP pin produces a slower ramp, reducing inrush current from capacitive loads.

#### SLG59M1709V Current Limiting Operation

The SLG59M1709V has two types of current limiting triggered by the output  $V_{OUT}$  voltage.

##### 1. Standard Current Limiting Mode (with Thermal Shutdown Protection)

When the  $V_{OUT}$  voltage > 300 mV, the output current is initially limited to the Active Current Limit ( $I_{ACL}$ ) specification listed in the Electrical Characteristics table. The ACL monitor's response time is very fast and is triggered within a few microseconds to sudden (transient) changes in load current. When a load current overload is detected, the ACL monitor increases the FET resistance to keep the current from exceeding the load switch's  $I_{ACL}$  threshold. During active current-limit operation,  $V_{OUT}$  is also reduced by  $I_{ACL} \times RDS_{ON(ACL)}$ . This observed behavior is illustrated in the timing diagrams on Pages 7 and 8.

However, if a load-current overload condition persists where the die temperature rises because of the increased FET resistance, the load switch's internal Thermal Shutdown Protection circuit can be activated. If the die temperature exceeds the listed  $THERM_{ON}$  specification, the FET is shut OFF completely, thereby allowing the die to cool. When the die cools to the listed  $THERM_{OFF}$  temperature threshold, the FET is allowed to turn back on. This process may repeat as long as the output current overload condition persists.

##### 2. Short Circuit Current Limiting Mode (with Thermal Shutdown Protection)

When the  $V_{OUT}$  voltage < 300 mV (which is the case with a hard short, such as a solder bridge on the power rail), the load switch's internal Short-circuit Current Limit (SCL) monitor limits the FET current to approximately 500 mA (the  $I_{SCL}$  threshold). While the internal Thermal Shutdown Protection circuit remains enabled and since the  $I_{SCL}$  threshold is much lower than the  $I_{ACL}$  threshold, thermal shutdown protection may become activated only at higher ambient temperatures.

#### SLG59M1709V Start-up Inrush Current Considerations with Capacitive Loads

In distributed power applications, the SLG59M1709V is generally implemented on the outboard or downstream side of switching regulator dc/dc converters with internal overcurrent protection. As an adjustable output voltage slew-rate load switch, it is important to understand the start-up operation of the SLG59M1709V with capacitive loads. An equivalent circuit of the SLG59M1709V's slew-rate control loop with capacitors at its  $V_{IN}$  and  $V_{OUT}$  pins is shown in Figure 1:

## SLG59M1709V

An Ultra-small, 4 mΩ, 4 A Load Switch  
with Multiple Protection Features

### SLG59M1709V Start-up Inrush Current Considerations with Capacitive Loads (continued)

Figure 1. SLG59M1709V's Equivalent Slew-rate Control Loop Circuit.

For a desired  $V_{OUT}$  slew-rate ( $V_{OUT(SR)}$ ), a corresponding  $C_{SLEW}$  value is selected. At the  $V_{OUT}$  pin and with  $ON = LOW$ , the internal FET is OFF,  $V_{OUT}$  is initially at 0V, and there is no stored charge on  $C_{LOAD}$ . When a low-to-high transition is applied to the IC's  $ON$  pin, an internal current source ( $I_1$ ) is enabled which, in turn, charges the external slew-rate capacitor,  $C_{SLEW}$ . The SLG59M1709V's internal micropower op amp sets the circuit's  $V_{OUT(SR)}$  based on the slew rate of the nodal voltage at its non-inverting pin (the voltage at the CAP pin).

As a function of  $V_{OUT(SR)}$  and  $C_{LOAD}$ , a 1st-order expression for the circuit's FET current (and inrush current) when a low-to-high transition on the  $ON$  pin is applied becomes:

$$\text{Start-up Current } I_{DS} \text{ or } I_{INRUSH} = V_{OUT(SR)} \times C_{LOAD}$$

From the expression above and for a given  $V_{OUT(SR)}$ ,  $C_{LOAD}$  determines the magnitude of the inrush current; that is, for large values of  $C_{LOAD}$ , large inrush currents can result. If the inrush currents are large enough to trigger the overcurrent protection of an upstream dc/dc converter, the system can be shut down.

In applications where the desired  $V_{OUT(SR)}$  is fast and  $C_{LOAD}$  is very large ( $>200 \mu F$ ), there is a secondary effect on the observed  $V_{OUT(SR)}$  attributed to the SLG59M1709V's internal short-circuit current limit monitor (its SCL monitor). If the resultant inrush current is larger than the IC's  $I_{SCL}$  threshold, the SCL current monitor limits the inrush current and the current to charge  $C_{LOAD}$  until the  $I_{SCL}$  OFF threshold is crossed ( $\sim 0.3V$ ). During the time the SCL monitor's been activated, the inrush current profile may exhibit an observable reduction in  $V_{OUT(SR)}$  as shown in Figure 2 where  $C_{SLEW}$  was set to 4nF and 470  $\mu F$  was chosen for  $C_{LOAD}$ .

## SLG59M1709V

An Ultra-small, 4 mΩ, 4 A Load Switch with Multiple Protection Features

### SLG59M1709V Start-up Inrush Current Considerations with Capacitive Loads (continued)

**Figure 2.** A SLG59M1709V with  $C_{SLEW}$  set to 4nF and 470μF for  $C_{LOAD}$ .  $C_{LOAD}$ -to- $C_{SLEW}$  ratio is greater than 33,600. Note that the internal SCL monitor's been triggered and  $V_{OUT(SR)}$  is reduced until  $V_{OUT}$  reaches ~0.3V.

A closer analysis of the IC's internal slew-control large-scale yields the following:

$$\frac{I_{SCL}}{C_{LOAD}} = M_{SR} \times \frac{I_1}{C_{SLEW}}$$

where

$I_{SCL}$  = IC's short-circuit current limit threshold, typically 0.5A;

$M_{SR}$  = An internal slew-rate multiplier from the IC's CAP pin to the VOUT pin;

$I_1$  = An internal current source to charge the external capacitor ( $C_{SLEW}$ ).

Rearranging the equation to isolate both  $C_{LOAD}$  and  $C_{SLEW}$  yields the following:

$$\frac{C_{LOAD}}{C_{SLEW}} = \frac{I_{SCL}}{I_1 \times M_{SR}}$$

For the SLG59M1709V device, the right-hand side of the expression is approximately 33,600 after taking into account part-to-part variations because of process, voltage, and temperature.

Referring to the configuration of Figure 2's scope capture, the  $C_{LOAD}$ -to- $C_{SLEW}$  ratio is 117,500 (470μF/4nF) where it is evident that the SCL monitor circuit is charging  $C_{LOAD}$  shortly after a low-to-high ON transition. If it is desired to avoid a reduction in  $V_{OUT(SR)}$ , the choices are decreasing  $C_{LOAD}$  and/or increasing  $C_{SLEW}$  so that the ratio is always less than 33,600 including taking into account external capacitor tolerances for initial accuracy and temperature.

As shown in Figure 3, it was chosen to reduce  $V_{OUT(SR)}$  by increasing  $C_{SLEW}$  to 15nF while keeping  $C_{LOAD}$  at 470μF. With this configuration, the ratio of  $C_{LOAD}$  to  $C_{SLEW}$  is about 31,333 (smaller than 33,600). Upon a low-to-high transition on the ON pin, the  $V_{OUT}$  increases smoothly with no evidence of SCL monitor's interaction.

## SLG59M1709V

An Ultra-small, 4 mΩ, 4 A Load Switch with Multiple Protection Features

### SLG59M1709V Start-up Inrush Current Considerations with Capacitive Loads (continued)

Figure 3. A SLG59M1709V with  $C_{SLEW}$  set to 15nF and 470μF retained for  $C_{LOAD}$ .  $C_{LOAD}$ -to- $C_{SLEW}$  ratio is smaller than 33,600. Note smooth  $V_{OUT}$  transition.

### Power Dissipation

The junction temperature of the SLG59M1709V depends on different factors such as board layout, ambient temperature, and other environmental factors. The primary contributor to the increase in the junction temperature of the SLG59M1709V is the power dissipation of its power MOSFET. Its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD = RDS_{ON} \times I_{DS}^2$$

where:

PD = Power dissipation, in Watts (W)

$RDS_{ON}$  = Power MOSFET ON resistance, in Ohms ( $\Omega$ )

$I_{DS}$  = Output current, in Amps (A)

and

$$T_J = PD \times \theta_{JA} + T_A$$

where:

$T_J$  = Junction temperature, in Celsius degrees ( $^{\circ}C$ )

$\theta_{JA}$  = Package thermal resistance, in Celsius degrees per Watt ( $^{\circ}C/W$ )

$T_A$  = Ambient temperature, in Celsius degrees ( $^{\circ}C$ )

## SLG59M1709V

### An Ultra-small, 4 mΩ, 4 A Load Switch with Multiple Protection Features

#### Power Dissipation (continued)

During active current-limit operation, the SLG59M1709V's power dissipation can be calculated by taking into account the voltage drop across the load switch ( $V_{IN}-V_{OUT}$ ) and the magnitude of the output current in active current-limit operation ( $I_{ACL}$ ):

$$PD = (V_{IN}-V_{OUT}) \times I_{ACL} \text{ or}$$

$$PD = (V_{IN} - (R_{LOAD} \times I_{ACL})) \times I_{ACL}$$

where:

PD = Power dissipation, in Watts (W)  
 $V_{IN}$  = Input Voltage, in Volts (V)  
 $R_{LOAD}$  = Load Resistance, in Ohms ( $\Omega$ )  
 $I_{ACL}$  = Output limited current, in Amps (A)  
 $V_{OUT} = R_{LOAD} \times I_{ACL}$
