

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

To all our customers

Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renesas Technology Corp.

The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Hitachi, Hitachi, Ltd., Hitachi Semiconductors, and other Hitachi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Cautions

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

HD404829R Series

AS Microcomputer Incorporating a LCD controller/Driver Circuit

ADE-202-057C

Rev.4

Sept. 1999

Description

The HD404829R series incorporates an 8-bit A/D converter (four channels), a Liquid Crystal Display (LCD) and a serial interface, and has large-current Input/Output (I/O) pins. The series is a 4-bit single-chip microcomputer best used in the AV equipment such as CD radio cassette tape recorders which require the LCD display control.

The HD404829R Series, with a 32.768kHz sub-oscillator for clocks, counts up the system clock and a variety of power modes can reduce power consumption.

The HD4074829 is a ZTAT™ microcomputer which incorporates a PROM. System development period has been dramatically reduced so that the process from debugging to mass production is smooth. (The PROM programming specifications are the same as those for Type 27256.)

ZTAT™: Zero Turn Around Time ZTAT is a trademark of Hitachi Ltd.

Features

- 1,876-digit × 4-bit RAM
- 44 I/O pins, including 10 high-current pins (15 mA, max.) and 20 pins multiplexed with LCD segment pins
- Four timer/counters
- 8-bit input capture circuit
- Three timer outputs (including two PWM out-puts)
- Two event counter inputs (including one double-edge function)
- Clock-synchronous 8-bit serial interface
- A/D converter (4 channels × 8 bits)
- LCD controller/driver (52 segments × 4 commons)
- Built-in oscillators
 - Main clock: 4.2-MHz ceramic (an external clock is also possible)
 - Subclock: 32.768-kHz crystal
- Eleven interrupt sources
 - Five by external sources, including three double-edge functions

HD404829R Series

- Six by internal sources
- Subroutine stack up to 16 levels, including interrupts
- Four low-power dissipation modes
 - Subactive mode
 - Standby mode
 - Watch mode
 - Stop mode
- One external input for transition from stop mode to active mode
- Instruction cycle time (min.): $0.95 \mu\text{s}$ ($f_{\text{OSC}} = 4.2 \text{ MHz}$)
- Operation voltage
 - $V_{\text{CC}} = 2.7 \text{ V to } 6.0 \text{ V}$ (HD404829R)
 - $V_{\text{CC}} = 2.7 \text{ V to } 5.5 \text{ V}$ (HD4074829)
- Two operating modes
 - MCU mode
 - MCU/PROM mode (HD4074829 only)

		HD4074829FS		100-pin plastic QFP (FP-100A)
		HD4074829TF		100-pin plastic TQFP (TFP-100B)

Caution about operation!

It has been confirmed that the HD404829R Series, same as the ZTAT™ version HD4074829 and the conventional HD404829 Series, satisfies the electrical properties given on the data sheets, etc. However, effective values of the electrical properties, the operating margin, and the noise margin may differ with the manufacturing processes, on-chip ROM, and layout patterns. Therefore, conduct an evaluation test of your system using the ZTAT™ version and the mask ROM version. Also conduct a similar evaluation test for checkup before replacing your conventional product with the HD404829R Series.

List of Functions

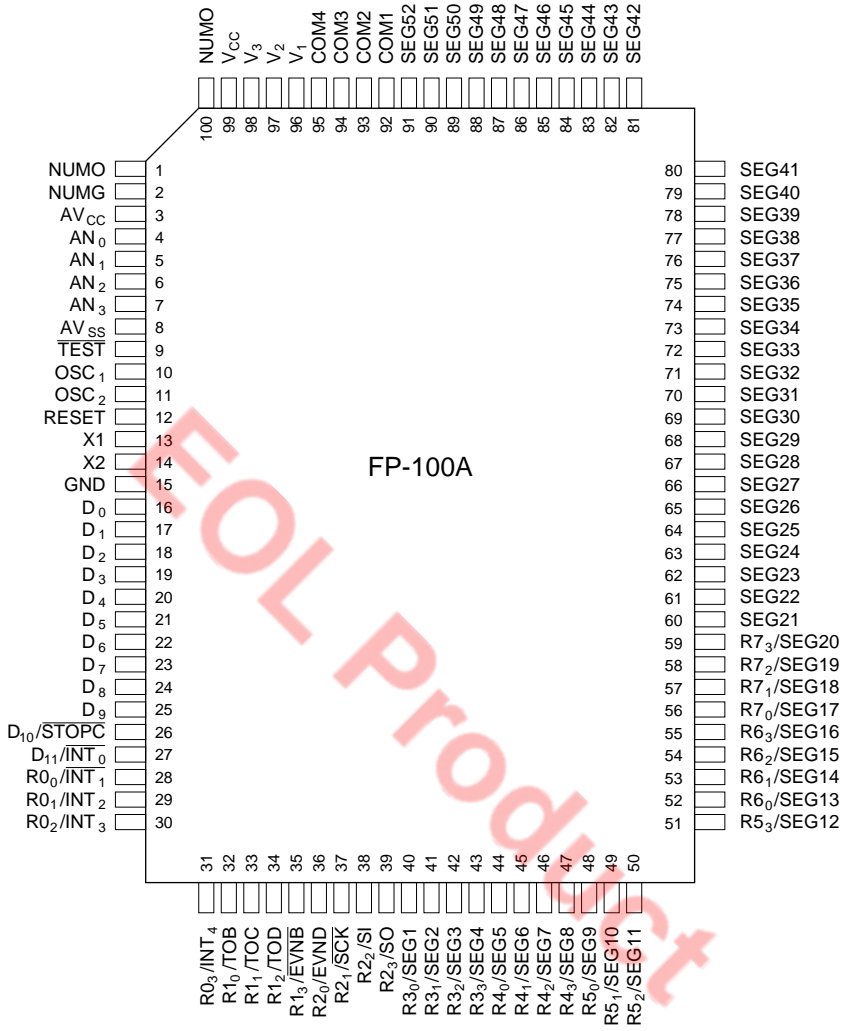

Product name		HD404828R	HD4048212R	HD404829R	HD4074829
ROM (Words)		8,192	12,288	16,384	16,384PROM
RAM (Digits)			1,876		
I/O			44 (max)		
Large-current I/O pins			10 (Sink 15 mA max)		
LCD segment multiplexed pins			20		
Timer / Counter			4		
Input capture			8 bit × 1		
Timer output			3 (PWM output possible for 2)		
Event input			2 (edge selection possible for 1)		
Serial interface			1 (8-bit synchronous)		
A/D converter			8 bit × 4 channels		
LCD controller / driver circuit			Max. 52 seg × 4 com		
Interrupts	External		5 (edge selection possible for 3)		
	Internal		6		
Low-Power Dissipation Mode			4		
Stop mode			0		
Watch mode			0		
Standby mode			0		
Subactive mode			0		
Main Oscillator	Ceramic oscillation		0 (0.4–4.2MHz)		
	Crystal oscillation		0 (0.4–4.2MHz)		—
Sub oscillator	Crystal oscillation		0 (32.768 kHz)		
Minimum instruction execution time			0.95 μs (f _{OSC} = 4.2 MHz)		
Operating voltage (V)			2.7 to 6.0		2.7 to 5.5
Package			100-pin plastic QFP (FP-100B) 100-pin plastic QFP (FP-100A) 100-pin plastic TQFP (TFP-100B)		
Guaranteed operation temperature (°C)			–20 to +75		

Pin Arrangement

Pin Description

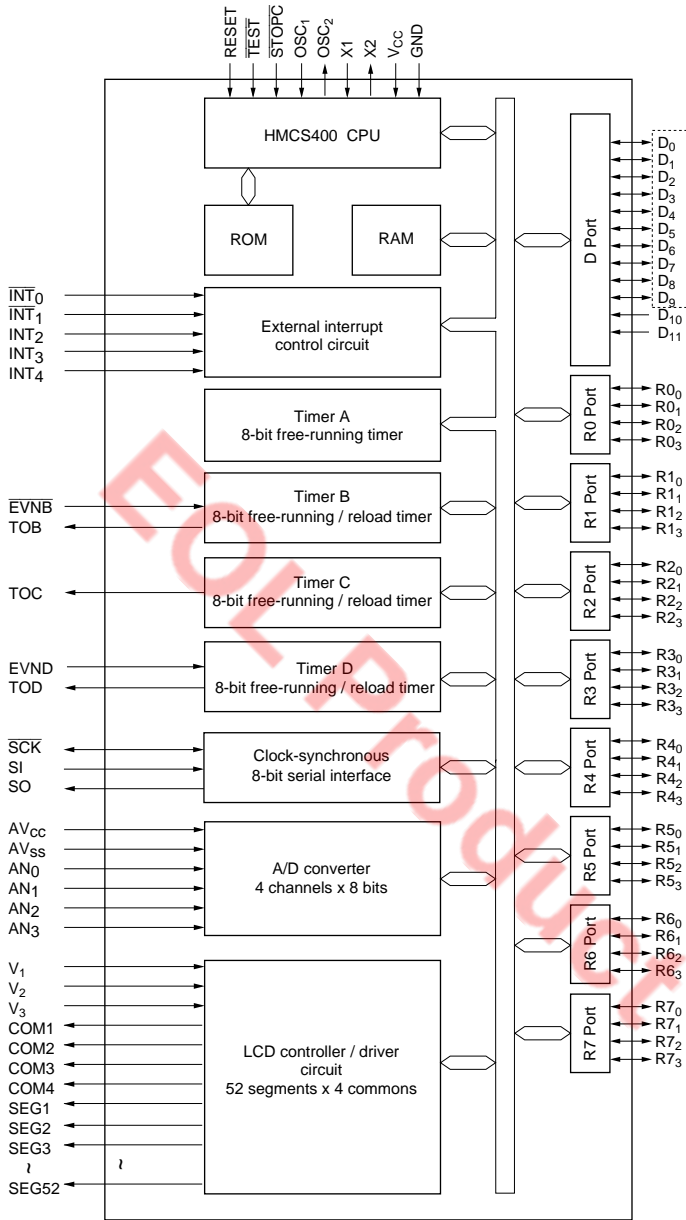

Item	Symbol	Pin Number		I/O	Function
		FP-100B TFP-100B	FP-100A		
Power supply	V _{CC}	97	99		Applies power voltage
	GND	13	15		Connected to ground
Test	$\overline{\text{TEST}}$	7	9	I	Used for factory testing only: Connect this pin to V _{CC}
Reset	RESET	10	12	I	Resets the MCU
Oscillator	OSC ₁	8	10	I	Input/output pins for the internal oscillator circuit:
	OSC ₂	9	11	O	Connect them to a ceramic oscillator, crystal oscillator or connect OSC ₁ to an external oscillator circuit
	X1	11	13	I	Used for a 32.768-kHz crystal for clock purposes.
	X2	12	14	O	If not to be used, fix the X1 pin to V _{CC} and leave the X2 pin open.
Port	D ₀ –D ₉	14–23	16–25	I/O	Input/output pins addressed by individual bits; pins D ₀ –D ₉ are high-current pins that can each supply up to 15 mA
	D ₁₀ , D ₁₁	24, 25	26, 27	I	Input pins addressable by individual bits
	R ₀ –R ₇ ₃	26–57	28–59	I/O	Input/output pins addressable in 4-bit units
Interrupt	$\overline{\text{INT}}_0$, $\overline{\text{INT}}_1$, INT_2 – INT_4	25–29	27–31	I	Input pins for external interrupts
Stop clear	$\overline{\text{STOPC}}$	24	26	I	Input pin for transition from stop mode to active mode
Serial interface	SCK	35	37	I/O	Serial interface clock input/output pin
	SI	36	38	I	Serial interface receive data input pin
	SO	37	39	O	Serial interface transmit data output pin
Timer	TOB, TOC, TOD	30–32	32–34	O	Timer output pins
	$\overline{\text{EVNB}}$, EVND	33, 34	35, 36	I	Event count input pins
LCD	V ₁ , V ₂ , V ₃	94–96	96–98		Power pins for LCD controller/driver; may be left open during operation since they are connected by internal voltage division resistors. Voltage conditions are: V _{CC} ≥ V ₁ ≥ V ₂ ≥ V ₃ ≥ GND
	COM1–COM4	90–93	92–95	O	Common signal pins for LCD
	SEG1–SEG52	38–89	40–91	O	Segment signal pins for LCD

HD404829R Series

Item	Symbol	Pin Number		I/O	Function
		FP-100B TFP-100B	FP-100A		
A/D converter	AV _{CC}	1	3		Power pin for A/D converter: Connect it to the same potential as V _{CC} , as physically close to the V _{CC} pin as possible
	AV _{SS}	6	8		Ground for AV _{CC} : Connect it to the same potential as GND, as physically close to the GND pin as possible
	AN ₀ –AN ₃	2–5	4–7	I	Analog input pins for A/D converter
NUMG	NUMG	100	2		These are not pins for user applications. Connect
NUMO	NUMO	98,99	100,1		NUMG to the same potential as GND. Leave NUMO open.

Memory Map

ROM Memory Map

The ROM memory map is shown in figure 1 and described below.

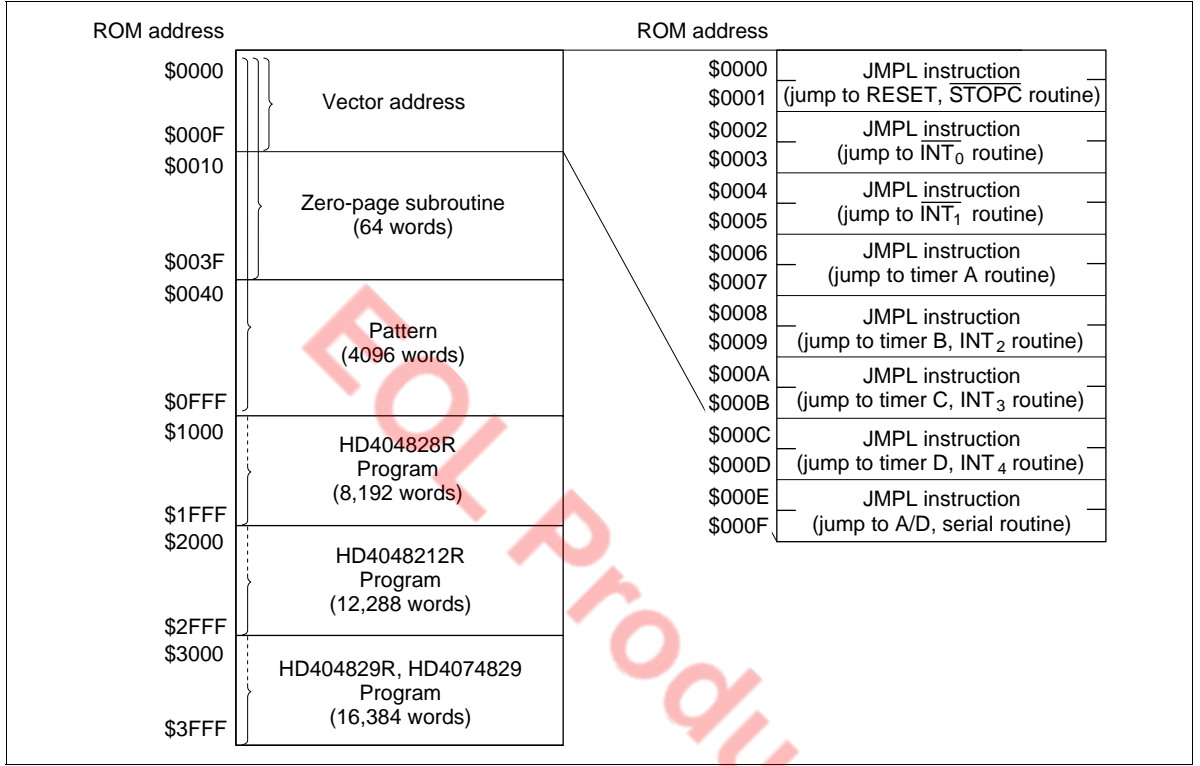

Figure 1 ROM Memory Map

Vector Address Area (\$0000–\$000F): Reserved for JMWPL instructions that branch to the start addresses of the reset and interrupt routines. After MCU reset or an interrupt, program execution continues from the vector address.

Zero-Page Subroutine Area (\$0000–\$003F): Reserved for subroutines. The program branches to a subroutine in this area in response to the CAL instruction.

Pattern Area (\$0000–\$0FFF): Contains ROM data that can be referenced with the P instruction.

Program Area (\$0000–\$1FFF: HD404828R; \$0000–\$2FFF: HD4048212R; \$0000–\$3FFF; HD404829R, HD4074829): Used for program coding.

RAM Memory Map

The MCU contains a 1,876-digit \times 4-bit RAM area consisting of a memory register area, an LCD data area, a data area, and a stack area. In addition, an interrupt control bits area, special register area, and register flag area are mapped onto the same RAM memory space as a RAM-mapped register area outside the above areas. The RAM memory map is shown in figure 2 and described below.

RAM-Mapped Register Area (\$000–\$03F):

- Interrupt Control Bits Area (\$000–\$003)

This area is used for interrupt control bits (figure 3). These bits can be accessed only by RAM bit manipulation instructions (SEM/SEMD, REM/REMD, and TM/TMD). However, note that not all the instructions can be used for each bit. Limitations on using the instructions are shown in figure 4.

- Special Function Register Area (\$004–\$01F, \$024–\$03F)

This area is used as mode registers and data registers for external interrupts, serial interface, timer/counters, LCD, A/D converter, and as data control registers for I/O ports. The structure is shown in figures 2 and 5. These registers can be classified into three types: write-only (W), read-only (R), and read/write (R/W). The SEM, SEMD, REM, and REMD instructions can be used for the LCD control register (LCR: \$01B), but RAM bit manipulation instructions cannot be used for other registers.

- Register Flag Area (\$020–\$023)

This area is used for the DTON, WDON, and other register flags and interrupt control bits (figure 3). These bits can be accessed only by RAM bit manipulation instructions (SEM/SEMD, REM/REMD, and TM/TMD). However, note that not all the instructions can be used for each bit. Limitations on using the instructions are shown in figure 4.

Figure 2 RAM Memory Map

RAM address	Bit 3	Bit 2	Bit 1	Bit 0
\$000	IM0 (IM of INT ₀)	IF0 (IF of INT ₀)	RSP (Reset SP bit)	IE (Interrupt enable flag)
\$001	IMTA (IM of timer A)	IFTA (IF of timer A)	IM1 (IM of INT ₁)	IF1 (IF of INT ₁)
\$002	IMTC (IM of timer C)	IFTC (IF of timer C)	IMTB (IM of timer B)	IFTB (IF of timer B)
\$003	IMAD (IM of A/D)	IFAD (IF of A/D)	IMTD (IM of timer D)	IFTD (IF of timer D)

Interrupt control bits area

	Bit 3	Bit 2	Bit 1	Bit 0
\$020	DTON (Direct transfer on flag)	ADSF (A/D start flag)	WDON (Watchdog on flag)	LSON (Low speed on flag)
\$021	RAME (RAM enable flag)	Not used	ICEF (Input capture error flag)	ICSF (Input capture status flag)
\$022	IM3 (IM of INT ₃)	IF3 (IF of INT ₃)	IM2 (IM of INT ₂)	IF2 (IF of INT ₂)
\$023	IMS (IM of serial interface)	IFS (IF of serial interface)	IM4 (IM of INT ₄)	IF4 (IF of INT ₄)

Register flag area

IF: Interrupt request flag
 IM: Interrupt mask
 IE: Interrupt enable flag
 SP: Stack pointer

Figure 3 Configuration of Interrupt Control Bits and Register Flag Areas

	SEM/SEMD	REM/REMD	TM/TMD
IE	Allowed	Allowed	Allowed
IM			
LSON			
IF	Not executed	Allowed	Allowed
ICSF			
ICEF			
RAME			
RSP	Not executed	Allowed	Inhibited
WDON	Allowed	Not executed	Inhibited
ADSF	Allowed	Inhibited	Allowed
DTON	Not executed in active mode	Allowed	Allowed
	Used in subactive mode		
Not used	Not executed	Not executed	Inhibited

Note: WDON is reset by MCU reset or by \overline{STOPC} enable for stop mode cancellation.
 The REM or REMD instruction must not be executed for ADSF during A/D conversion.
 DTON is always reset in active mode.
 If the TM or TMD instruction is executed for the inhibited bits or non-existing bits, the value in ST becomes invalid.

Figure 5 Special Function Register Area

Memory Register (MR) Area (\$040–\$04F): Consisting of 16 addresses, this area (MR0–MR15) can be accessed by register-register instructions (LAMR and XMRA). The structure is shown in figure 6.

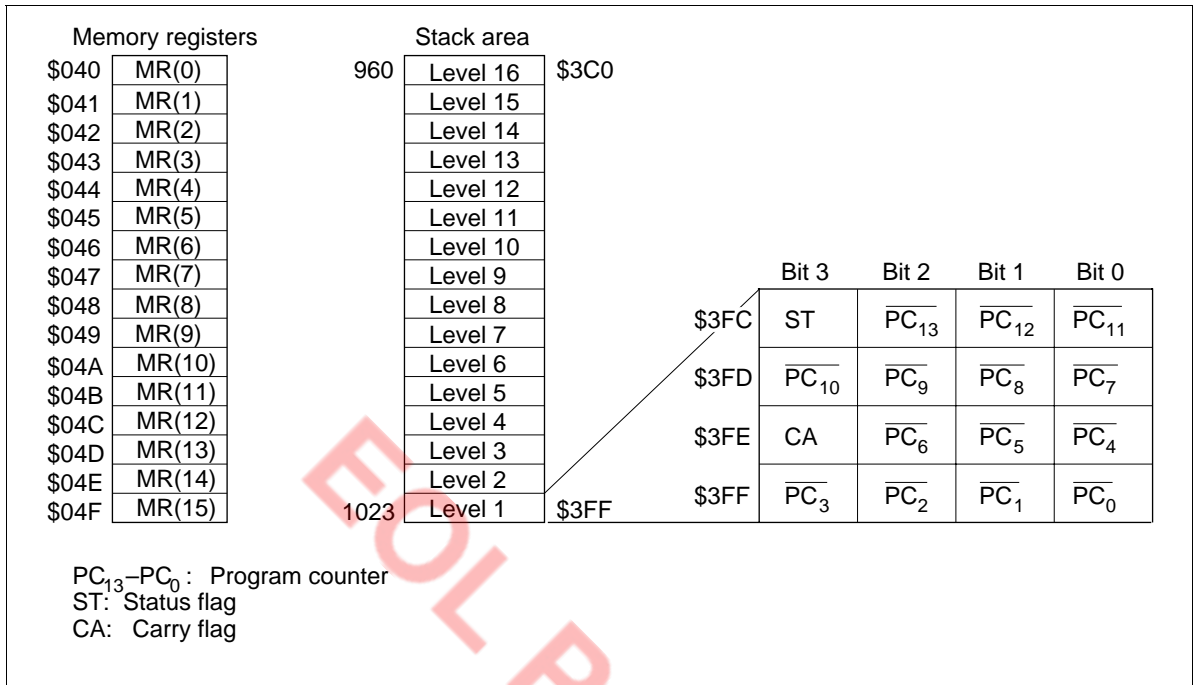

Figure 6 Configuration of Memory Registers and Stack Area, and Stack Position

HD404829R Series

LCD Data Area (\$050–\$083): Used for storing 52-digit LCD data which is automatically output to LCD segments as display data. Data 1 lights the corresponding LCD segment; data 0 extinguishes it. Refer to the LCD description for details.

Data Area (\$090–\$3BF): 464 digits from \$090 to \$25F have three banks, which can be selected by setting the bank register (V: \$03F). Before accessing this area, set the bank register to the required value (figure 7). The area from \$260 to \$3BF is accessed without setting the bank register.

Bank register (V: \$03F)

Bit	3	2	1	0
Initial value	—	—	0	0
Read/Write	—	—	R/W	R/W
Bit name	Not used	Not used	V1	V0

V1	V0	Bank area selection
0	0	Bank 0 is selected
	1	Bank 1 is selected
1	0	Bank 2 is selected
	1	Not used

Note: After reset, the value in the bank register is 0, and therefore bank 0 is selected. If V1 = 1 and V0 = 1, no bank is selected, and the operation is not guaranteed.

Figure 7 Bank Register (V)

Stack Area (\$3C0–\$3FF): Used for saving the contents of the program counter (PC), status flag (ST), and carry flag (CA) at subroutine call (CAL or CALL instruction) and for interrupts. This area can be used as a 16-level nesting subroutine stack in which one level requires four digits. The data to be saved and the save conditions are shown in figure 6.

The program counter is restored by either the RTN or RTNI instruction, but the status and carry flags can only be restored by the RTNI instruction. Any unused space in this area is used for data storage.

Functional Description

Registers and Flags

The MCU has nine registers and two flags for CPU operations. They are shown in figure 8 and described below.

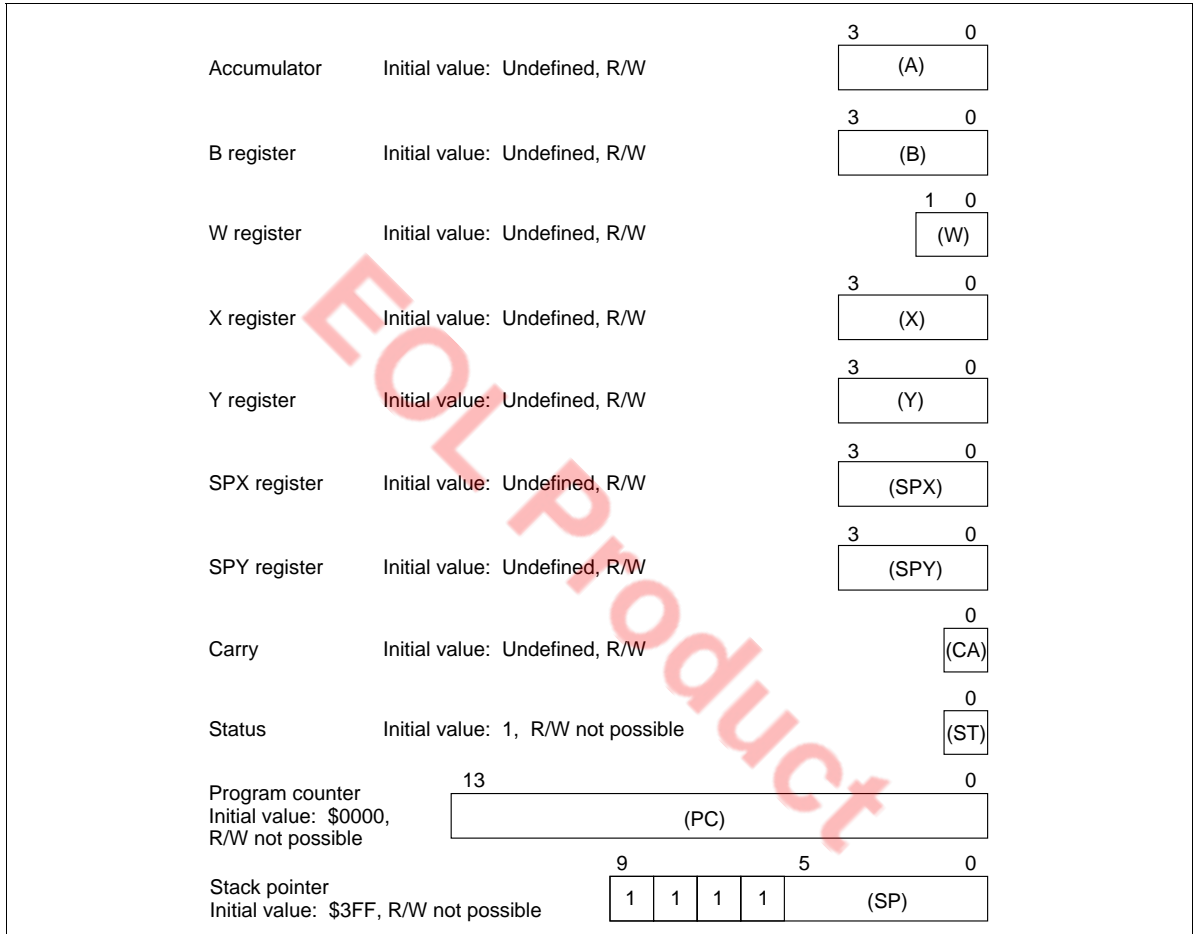

Figure 8 Registers and Flags

Accumulator (A) and B Register (B)

A and B are 4-bit registers, and are used to hold the results of ALU(arithmetic and logical unit) operations and to transfer data between memory, I/O ports, and other registers.

W Register (W), X Register (X), Y Register (Y)

W is a 2-bit register and X and Y are 4-bit registers. These registers are used in RAM register indirect addressing. The Y register is also used in D port addressing.

SPX Register (SPX) and SPY Register (SPY)

The SPX and SPY registers are 4-bit registers used to supplement the X and Y registers.

Carry Flag (CA)

CA is a 1-bit flag that stores ALU overflow generated by an arithmetic operation. CA is set to 1 when an overflow is generated, and is cleared to 0 after operations in which no overflow occurred. CA is also affected by the carry set/carry clear instructions (SEC and REC), and by the rotate with carry instructions (ROTL and ROTR.)

During interrupt handling, CA is saved on the stack, and is restored from the stack by the RTNI instruction.

Status Flag (ST)

ST is a 1-bit flag that stores the results of arithmetic instructions, compare instructions, and bit test instructions, and is used as the branch condition for the BR, BRL, CAL, and CALL conditional branch instructions.

The contents of the ST flag are held until the next arithmetic, compare, bit test, or conditional branch instruction is executed. After the execution of a conditional branch instruction, the value of ST is set to 1 without regard to the condition.

During interrupt handling, ST is saved on the stack, and is restored from the stack by the RTNI instruction.

Program Counter (PC)

The PC is a 14-bit counter that indicates the ROM address of the next instruction the CPU will execute.

Stack Pointer (SP)

The SP is a 10-bit register that indicates the RAM address of the next stack frame in the stack area.

The SP is initialized to \$3FF by a reset. The SP is decremented by 4 by a subroutine call or by interrupt handling, and is incremented by 4 when the saved data has been restored by a return instruction.

The upper 4 bits of the SP are fixed at 1111; the maximum number of stack levels is thus 16.

In addition to the reset method described above, the SP can also be initialized to \$3FF by clearing the reset stack pointer (RSP) in the interrupt control bits area with a RAM bit manipulation instruction, i.e., REM or REMD.

Reset

The MCU is reset by inputting a high-level voltage to the RESET pin. At power-on or when stop mode is cancelled, RESET must be high for at least one t_{RC} to enable the oscillator to stabilize. During operation, RESET must be high for at least two instruction cycles.

Initial values after MCU reset are listed in table 1.

Table 1 Initial Values After MCU Reset

Item	Abbr.	Initial Value	Contents		
Program counter	(PC)	\$0000	Indicates program execution point from start address of ROM area		
Status flag	(ST)	1	Enables conditional branching		
Stack pointer	(SP)	\$3FF	Stack level 0		
Interrupt flags/mask	Interrupt enable flag	(IE)	0	Inhibits all interrupts	
	Interrupt request flag	(IF)	0	Indicates there is no interrupt request	
	Interrupt mask	(IM)	1	Prevents (masks) interrupt requests	
I/O	Port data register	(PDR)	All bits 1	Enables output at level 1	
	Data control register	(DCD0, DCD1)	All bits 0	Turns output buffer off (to high impedance)	
		(DCD2)	--00		
		(DCR0, -DCR7)	All bits 0		
	Port mode register A	(PMRA)	--00	Refer to description of port mode register A	
	Port mode register B	(PMRB)	0000	Refer to description of port mode register B	
	Port mode register C bits 3, 1, 0	(PMRC3, PMRC1, PMRC0)	000	Refer to description of port mode register C	
	Detection edge select register 1	(ESR1)	0000	Disables edge detection	
	Detection edge select register 2	(ESR2)	0000	Disables edge detection	
	Timer/ counters, serial interface	Timer mode register A	(TMA)	0000	Refer to description of timer mode register A
		Timer mode register B1	(TMB1)	0000	Refer to description of timer mode register B1
		Timer mode register B2	(TMB2)	--00	Refer to description of timer mode register B2
		Timer mode register C1	(TMC1)	0000	Refer to description of timer mode register C1
Timer mode register C2		(TMC2)	-000	Refer to description of timer mode register C2	
Timer mode register D1		(TMD1)	0000	Refer to description of timer mode register D1	
Timer mode register D2		(TMD2)	0000	Refer to description of timer mode register D2	
Serial mode register A		(SMRA)	0000	Refer to description of serial mode register A	
Serial mode register B		(SMRB)	--x0	Refer to description of serial mode register B	
Prescaler S		(PSS)	\$000	—	
Prescaler W		(PSW)	\$00	—	
Timer counter A		(TCA)	\$00	—	
Timer counter B		(TCB)	\$00	—	
Timer counter C		(TCC)	\$00	—	
Timer counter D		(TCD)	\$00	—

B register	(B)			
W register	(W)			
X/SPX register	(X/SPX)			
Y/SPY register	(Y/SPY)			
Serial data register	(SRL, SRU)			
RAM		Pre-stop-mode values are retained		
RAM enable flag	(RAME)	1	0	0
Port mode register C bit 2	(PMRC2)	Pre-stop-mode values are retained		0
System clock select register bit 3	(SSR3)			

Interrupts

The MCU has 11 interrupt sources: five external signals ($\overline{\text{INT}}_0$, $\overline{\text{INT}}_1$, INT_2 – INT_4), four timer/ counters (timers A, B, C, and D), serial interface, and A/D converter.

An interrupt request flag (IF), interrupt mask (IM), and vector address are provided for each interrupt source, and an interrupt enable flag (IE) controls the entire interrupt process.

Some vector addresses are shared by two different interrupts. They are timer B and INT_2 , timer C and INT_3 , timer D and INT_4 , and A/D converter and serial interface interrupts. So the type of request that has occurred must be checked at the beginning of interrupt processing.

Interrupt Control Bits and Interrupt Processing: Locations \$000 to \$003 and \$022 to \$023 in RAM are reserved for the interrupt control bits which can be accessed by RAM bit manipulation instructions.

The interrupt request flag (IF) cannot be set by software. MCU reset initializes the interrupt enable flag (IE) and the IF to 0 and the interrupt mask (IM) to 1.

A block diagram of the interrupt control circuit is shown in figure 9, interrupt priorities and vector addresses are listed in table 2, and interrupt processing conditions for the 11 interrupt sources are listed in table 3.

An interrupt request occurs when the IF is set to 1 and the IM is set to 0. If the IE is 1 at that point, the interrupt is processed. A priority programmable logic array (PLA) generates the vector address assigned to that interrupt source.

The interrupt processing sequence is shown in figure 10 and an interrupt processing flowchart is shown in figure 11. After an interrupt is acknowledged, the previous instruction is completed in the first cycle. The IE is reset in the second cycle, the carry, status, and program counter values are pushed onto the stack

HD404829R Series

during the second and third cycles, and the program jumps to the vector address to execute the instruction in the third cycle.

Program the JMPL instruction at each vector address, to branch the program to the start address of the interrupt program, and reset the IF by a software instruction within the interrupt program.

Table 2 Vector Addresses and Interrupt Priorities

Reset/Interrupt	Priority	Vector Address
RESET, STOPC*	—	\$0000
$\overline{\text{INT}}_0$	1	\$0002
$\overline{\text{INT}}_1$	2	\$0004
Timer A	3	\$0006
Timer B, INT2	4	\$0008
Timer C, INT3	5	\$000A
Timer D, INT4	6	\$000C
A/D, Serial	7	\$000E

Note: * The $\overline{\text{STOPC}}$ interrupt request is valid only in stop mode.

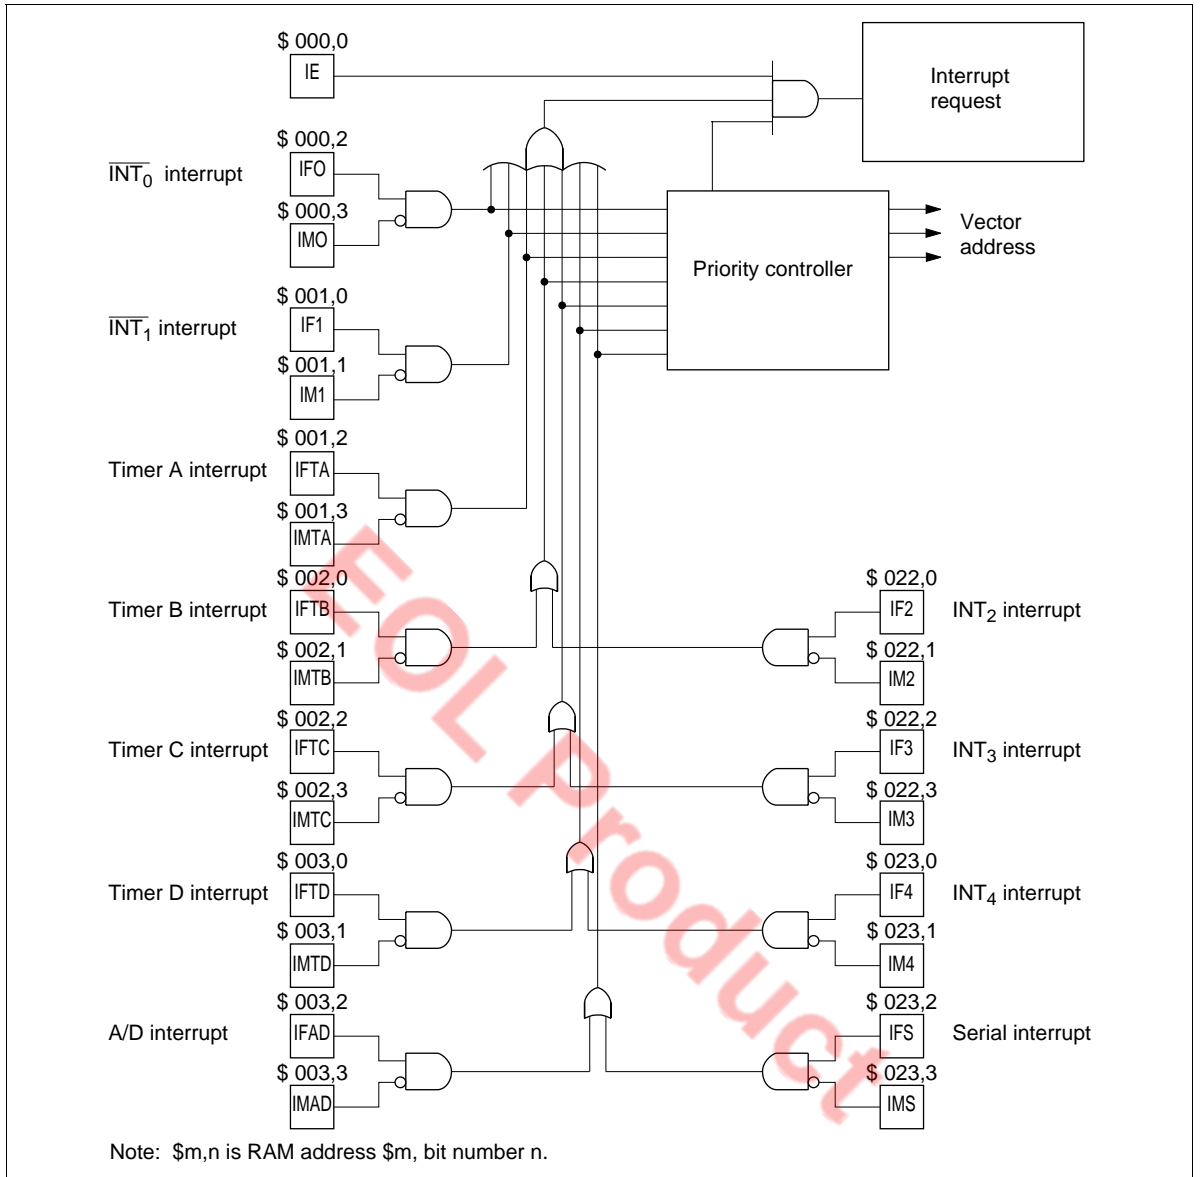

Figure 9 Interrupt Control Circuit

Table 3 Interrupt Processing and Activation Conditions

Interrupt Control Bit	Interrupt Source						
	\overline{INT}_0	\overline{INT}_1	Timer A	Timer B or INT_2	Timer C or INT_3	Timer D or INT_4	A/D or Serial
IE	1	1	1	1	1	1	1
IF0 · $\overline{IM0}$	1	0	0	0	0	0	0
IF1 · $\overline{IM1}$	*	1	0	0	0	0	0
IFTA · \overline{IMTA}	*	*	1	0	0	0	0
IFTB · \overline{IMTB} + IF2 · $\overline{IM2}$	*	*	*	1	0	0	0
IFTC · \overline{IMTC} + IF3 · $\overline{IM3}$	*	*	*	*	1	0	0
IFTD · \overline{IMTD} + IF4 · $\overline{IM4}$	*	*	*	*	*	1	0
IFAD · \overline{IMAD} + IFS · \overline{IMS}	*	*	*	*	*	*	1

Note: Bits marked * can be either 0 or 1. Their values have no effect on operation.

Operating Modes

The MCU has five operating modes as shown in table 13. The operations in each mode are listed in tables 14 and 15. Transitions between operating modes are shown in figure 14.

Active Mode: All MCU functions operate according to the clock generated by the system oscillator OSC₁ and OSC₂.

Table 13 Operating Modes and Clock Status

		Mode Name				
		Active	Standby	Stop	Watch	Subactive*2
Activation method		RESET cancellation, interrupt request, $\overline{\text{STOPC}}$ cancellation in stop mode, STOP/SBY instruction in subactive mode (when direct transfer is selected)	SBY instruction from active mode	STOP instruction when TMA3 = 0	STOP instruction when TMA3 = 1 or SBY instruction from subactive mode (when LSON = 1, or LSON and DTON are both 0)	AN interrupt request from timer A or $\overline{\text{INT}}_0$ in watch mode when LSON = 1
Status	System oscillator	Operating	Operating	Stopped	Stopped	Stopped
	Subsystem oscillator	Operating *1	Operating *1	Operating *1	Operating *1	Operating *1
Cancellation method		RESET input, STOP/SBY instruction	RESET input, interrupt request	RESET input, $\overline{\text{STOPC}}$ input in stop mode	RESET input, $\overline{\text{INT}}_0$ or timer A interrupt request	RESET input, STOP/SBY instruction

Notes: 1. Operating or stopping the oscillator can be selected by setting bit 3 of the system clock select register (SSR: \$029).

2. Subactive mode is an optional function; specify it on the function option list.

Table 14 Operations in Low-Power Dissipation Modes

Function	Stop Mode	Watch Mode	Standby Mode	Subactive Mode ^{*2}
CPU	Reset	Retained	Retained	Operating
RAM	Retained	Retained	Retained	Operating
Timer A	Reset	Operating	Operating	Operating
Timer B	Reset	Stopped	Operating	Operating
Timer C	Reset	Stopped	Operating	Operating
Timer D	Reset	Stopped	Operating	Operating
Serial interface	Reset	Stopped ^{*3}	Operating	Operating
A/D	Reset	Stopped	Operating	Stopped
LCD	Reset	Operating ^{*4}	Operating	Operating
I/O	Reset ^{*1}	Retained	Retained	Operating

- Notes: 1. Output pins are at high impedance.
 2. Subactive mode is an optional function specified on the function option list.
 3. Transmission/Reception is activated if a clock is input in external clock mode. However, interrupts stop.
 4. When a 32-kHz clock source is used.

Table 15 I/O Status in Low-Power Dissipation Modes

	Output		Input
	Standby Mode, Watch Mode	Stop Mode	Active Mode, Subactive Mode
D ₀ –D ₉	Retained	High impedance	Input enabled
D ₁₀ –D ₁₁	—	—	Input enabled
R0–R7	Retained or output of peripheral functions	High impedance	Input enabled

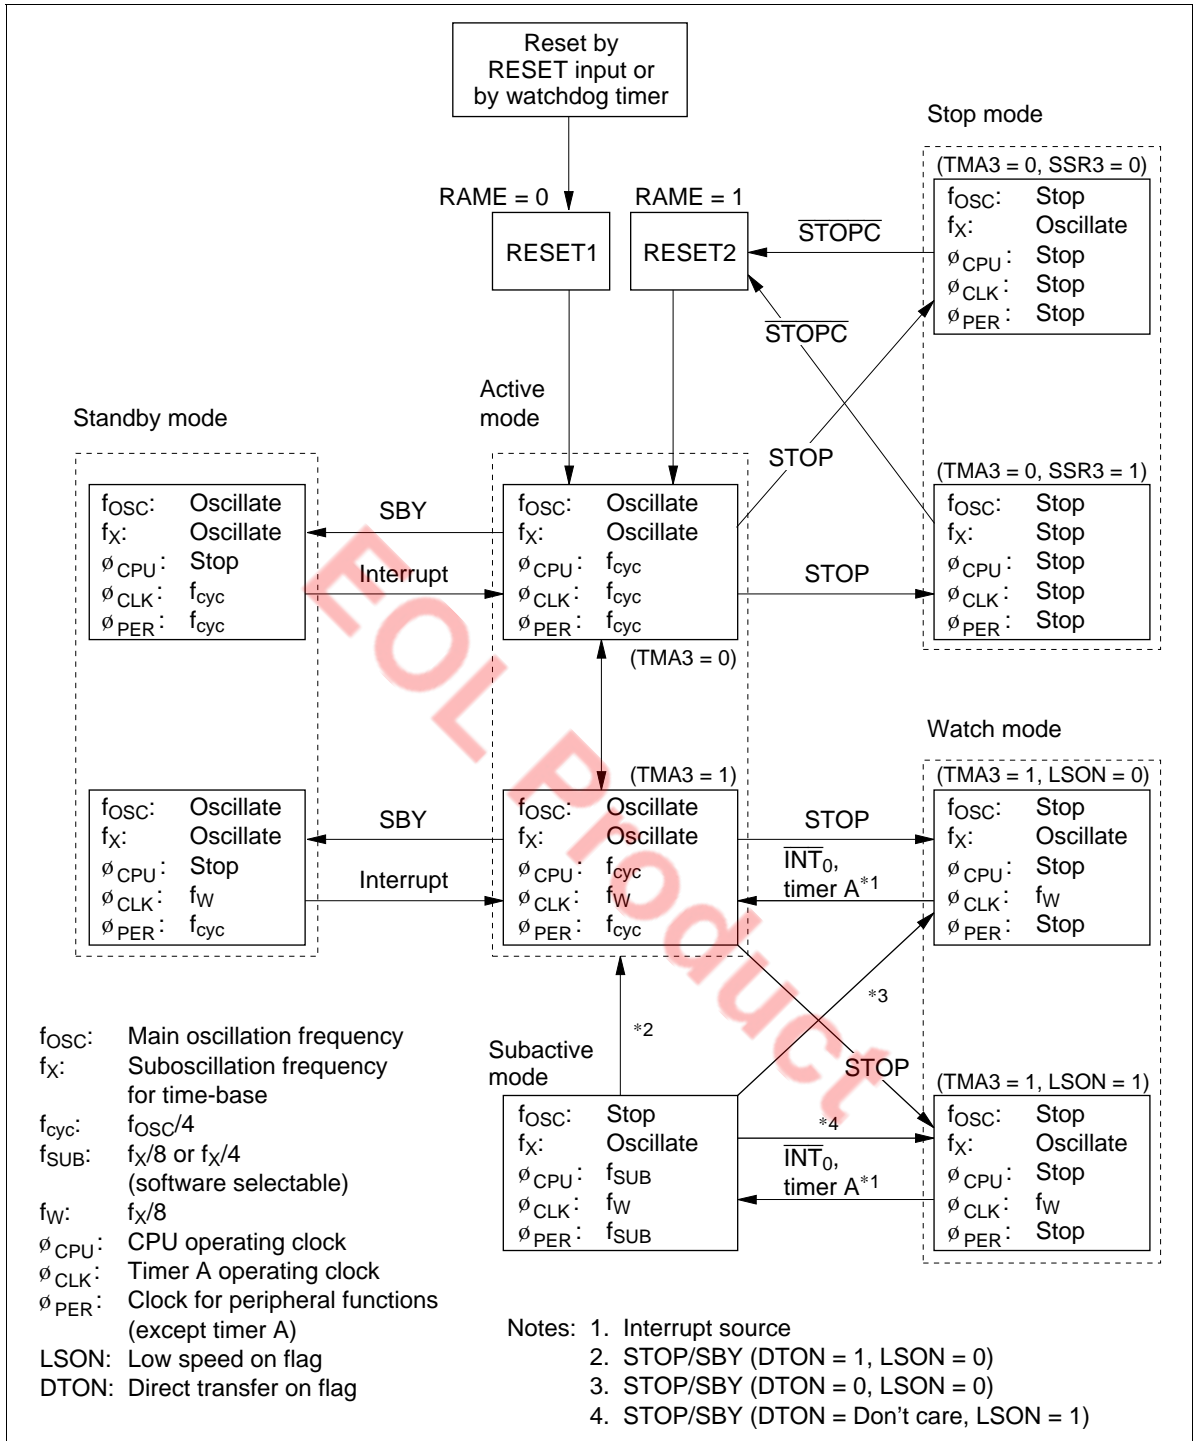

Figure 14 MCU Status Transitions

Standby Mode: In standby mode, the oscillators continue to operate, but the clocks related to instruction execution stop. Therefore, the CPU operation stops, but all RAM and register contents are retained, and the D or R port status, when set to output, is maintained. Peripheral functions such as interrupts, timers, and serial interface continue to operate. The power dissipation in this mode is lower than in active mode because the CPU stops.

The MCU enters standby mode when the SBY instruction is executed in active mode.

Standby mode is terminated by a RESET input or an interrupt request. If it is terminated by RESET input, the MCU is reset as well. After an interrupt request, the MCU enters active mode and executes the next instruction after the SBY instruction. If the interrupt enable flag is 1, the interrupt is then processed; if it is 0, the interrupt request is left pending and normal instruction execution continues. A flowchart of operation in standby mode is shown in figure 15.

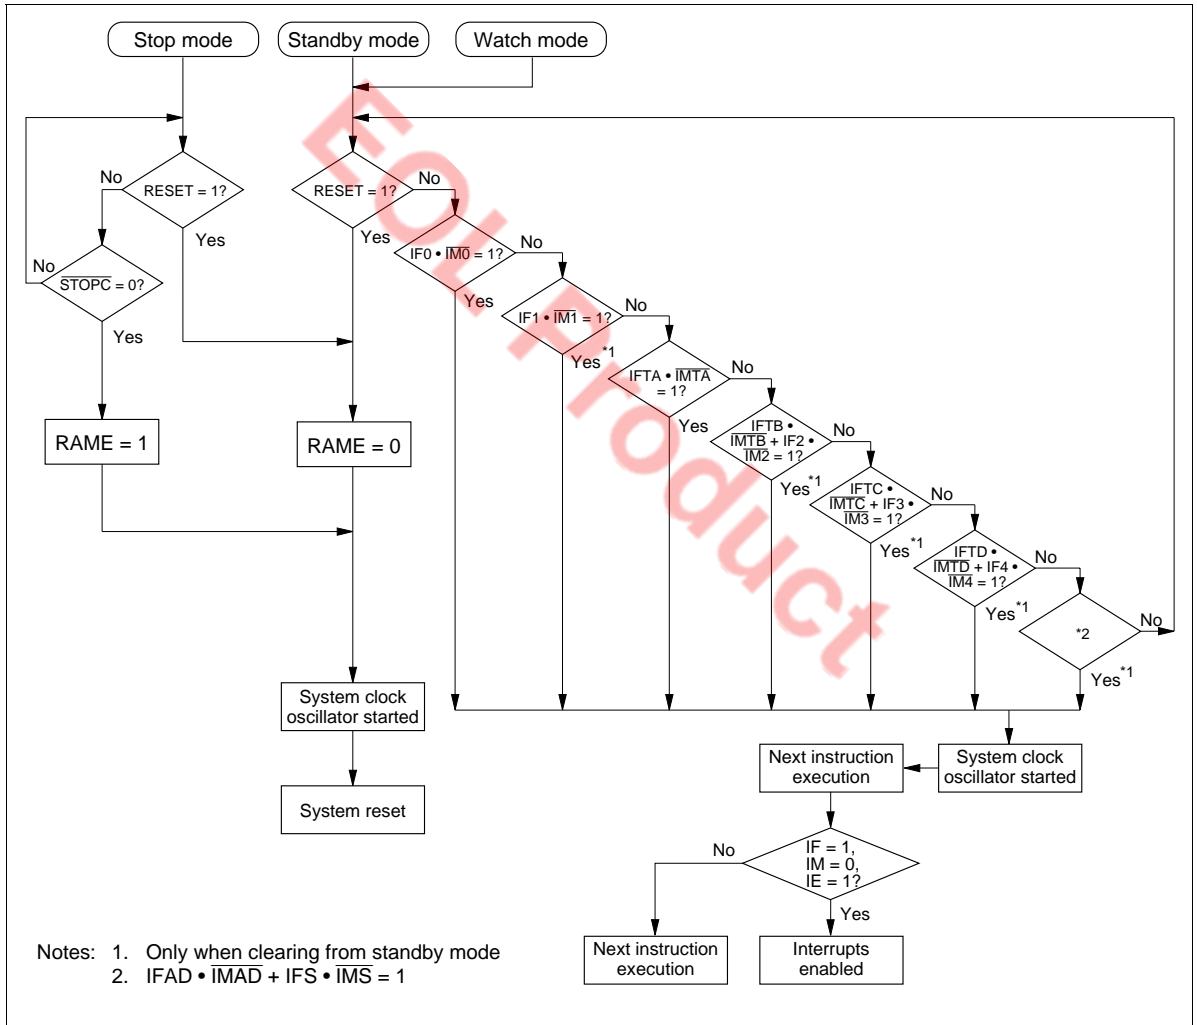

Figure 15 MCU Operation Flowchart

Stop Mode: In stop mode, all MCU operations stop and RAM data is retained. Therefore, the power dissipation in this mode is the least of all modes. The OSC_1 and OSC_2 oscillator stops. For the X1 and X2 oscillator to operate or stop can be selected by setting bit 3 of the system clock select register (SSR: \$029; operating: $SSR3 = 0$, stop: $SSR3 = 1$) (figure 27). The MCU enters stop mode if the STOP instruction is executed in active mode when bit 3 of timer mode register A (TMA: \$008) is set to 0 ($TMA3 = 0$) (figure 44).

Stop mode is terminated by a RESET input or a \overline{STOPC} input as shown in figure 16. RESET or \overline{STOPC} must be applied for at least one t_{RC} to stabilize oscillation (refer to the AC Characteristics section). When the MCU restarts after stop mode is cancelled, all RAM contents before entering stop mode are retained, but the accuracy of the contents of the accumulator, B register, W register, X/SPX register, Y/SPY register, carry flag, and serial data register cannot be guaranteed.

Figure 16 Timing of Stop Mode Cancellation

Watch Mode: In watch mode, the clock function (timer A) using the X1 and X2 oscillator and the LCD function operate, but other function operations stop. Therefore, the power dissipation in this mode is the second least to stop mode, and this mode is convenient when only clock display is used. In this mode, the OSC_1 and OSC_2 oscillator stops, but the X1 and X2 oscillator operates. The MCU enters watch mode if the STOP instruction is executed in active mode when $TMA3 = 1$, or if the STOP or SBY instruction is executed in subactive mode.

Watch mode is terminated by a RESET input or a timer-A/ $\overline{INT_0}$ interrupt request. For details of RESET input, refer to the Stop Mode section. When terminated by a timer-A/ $\overline{INT_0}$ interrupt request, the MCU enters active mode if $LSON = 0$, or subactive mode if $LSON = 1$. After an interrupt request is generated, the time required to enter active mode is t_{RC} for a timer A interrupt, and T_X (where $T + t_{RC} < T_X < 2T + t_{RC}$) for an $\overline{INT_0}$ interrupt, as shown in figures 17 and 18.

Operation during mode transition is the same as that at standby mode cancellation (figure 15).

Subactive Mode: The OSC₁ and OSC₂ oscillator stops and the MCU operates with a clock generated by the X1 and X2 oscillator. In this mode, functions except the A/D conversion operate. However, because the operating clock is slow, the power dissipation becomes low, next to watch mode.

The CPU instruction execution speed can be selected as 244 μs or 122 μs by setting bit 2 (SSR2) of the system clock select register (SSR: \$029). Note that the SSR2 value must be changed in active mode. If the value is changed in subactive mode, the MCU may malfunction.

When the STOP or SBY instruction is executed in subactive mode, the MCU enters either watch or active mode, depending on the statuses of the low speed on flag (LSON: \$020, bit 0) and the direct transfer on flag (DTON: \$020, bit 3).

Subactive mode is an optional function that the user must specify on the function option list.

Interrupt Frame: In watch and subactive modes, φ_{CLK} is applied to timer A and the $\overline{\text{INT}}_0$ circuit. Prescaler W and timer A operate as the time-base and generate the timing clock for the interrupt frame. Three interrupt frame lengths (T) can be selected by setting the miscellaneous register (MIS: \$00C) (figure 18).

In watch and subactive modes, the timer-A/ $\overline{\text{INT}}_0$ interrupt is generated synchronously with the interrupt frame. The interrupt request is generated synchronously with the interrupt strobe timing except during transition to active mode. The falling edge of the $\overline{\text{INT}}_0$ signal is input asynchronously with the interrupt frame timing, but it is regarded as input synchronously with the second interrupt strobe clock after the falling edge. An overflow and interrupt request in timer A is generated synchronously with the interrupt strobe timing.

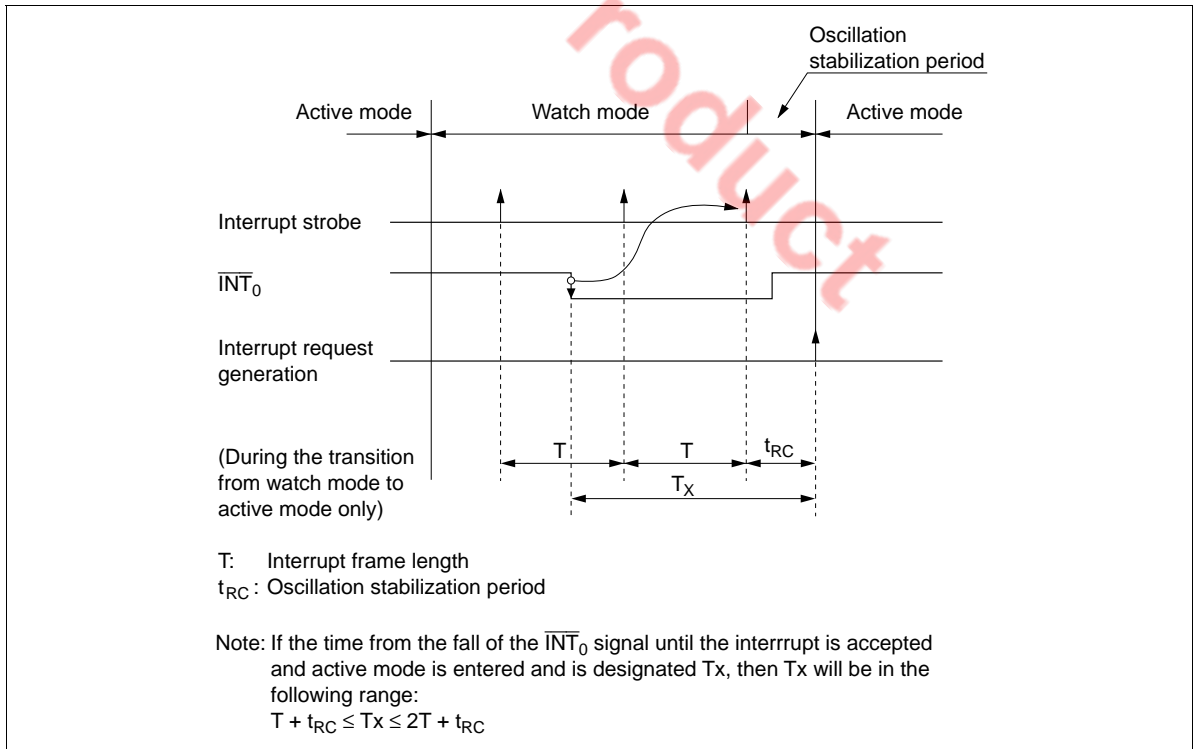

Figure 17 Interrupt Frame

Direct Transition from Subactive Mode to Active Mode: Available by controlling the direct transfer on flag (DTON: \$020, bit 3) and the low speed on flag (LSON: \$020, bit 0). The procedures are described below:

- Set LSON to 0 and DTON to 1 in subactive mode.
- Execute the STOP or SBY instruction.
- The MCU automatically enters active mode from subactive mode after waiting for the MCU internal processing time and oscillation stabilization time (figure 19).

Notes: 1. The DTON flag can be set only in subactive mode. It is always reset in active mode.
 2. The transition time (T_D) from subactive mode to active mode:

$$t_{RC} < T_D < T + t_{RC}$$

Miscellaneous register (MIS: \$00C)

Bit	3	2	1	0
Initial value	0	0	0	0
Read/Write	W	W	W	W
Bit name	MIS3	MIS2	MIS1	MIS0

MIS3	MIS2	MIS1	MIS0	T*1	t _{RC} *1	Oscillation circuit conditions
Buffer control. Refer to figure 41.		0	0	0.24414 ms	0.12207 ms	External clock input
					0.24414 ms*2	
		0	1	15.625 ms	7.8125 ms	Ceramic oscillator
		1	0	62.5 ms	31.25 ms	Crystal oscillator
		1	1	Not used	Not used	—

Notes: 1. Values of T and t_{RC} when a 32.768-kHz crystal oscillator is used to pins ×1 and ×2.
 2. The value is applied only when direct transfer operation is used.

Figure 18 Miscellaneous Register (MIS)

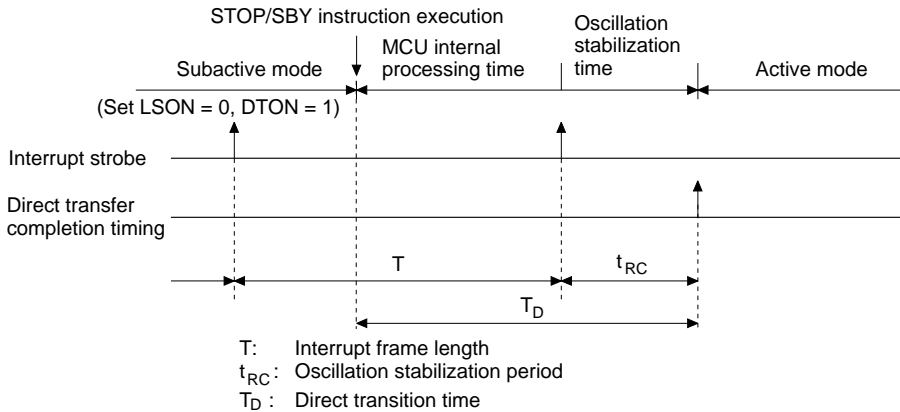

Figure 19 Direct Transition Timing

Stop Mode Cancellation by $\overline{\text{STOPC}}$: The MCU enters active mode from stop mode by inputting $\overline{\text{STOPC}}$ as well as by RESET. In either case, the MCU starts instruction execution from the starting address (address 0) of the program. However, the value of the RAM enable flag (RAME: \$021, bit 3) differs between cancellation by $\overline{\text{STOPC}}$ and by RESET. When stop mode is cancelled by RESET, RAME = 0; when cancelled by $\overline{\text{STOPC}}$, RAME = 1. RESET can cancel all modes, but $\overline{\text{STOPC}}$ is valid only in stop mode; $\overline{\text{STOPC}}$ input is ignored in other modes. Therefore, when the program requires to confirm that stop mode has been cancelled by $\overline{\text{STOPC}}$ (for example, when the RAM contents before entering stop mode is used after transition to active mode), execute the TEST instruction to the RAM enable flag (RAME) at the beginning of the program.

MCU Operation Sequence: The MCU operates in the sequence shown in figures 20 to 22. It is reset by an asynchronous RESET input, regardless of its status.

The low-power mode operation sequence is shown in figure 22. With the IE flag cleared and an interrupt flag set together with its interrupt mask cleared, if a STOP/SBY instruction is executed, the instruction is cancelled (regarded as a NOP) and the following instruction is executed. Before executing a STOP/SBY instruction, make sure all interrupt flags are cleared or all interrupts are masked.

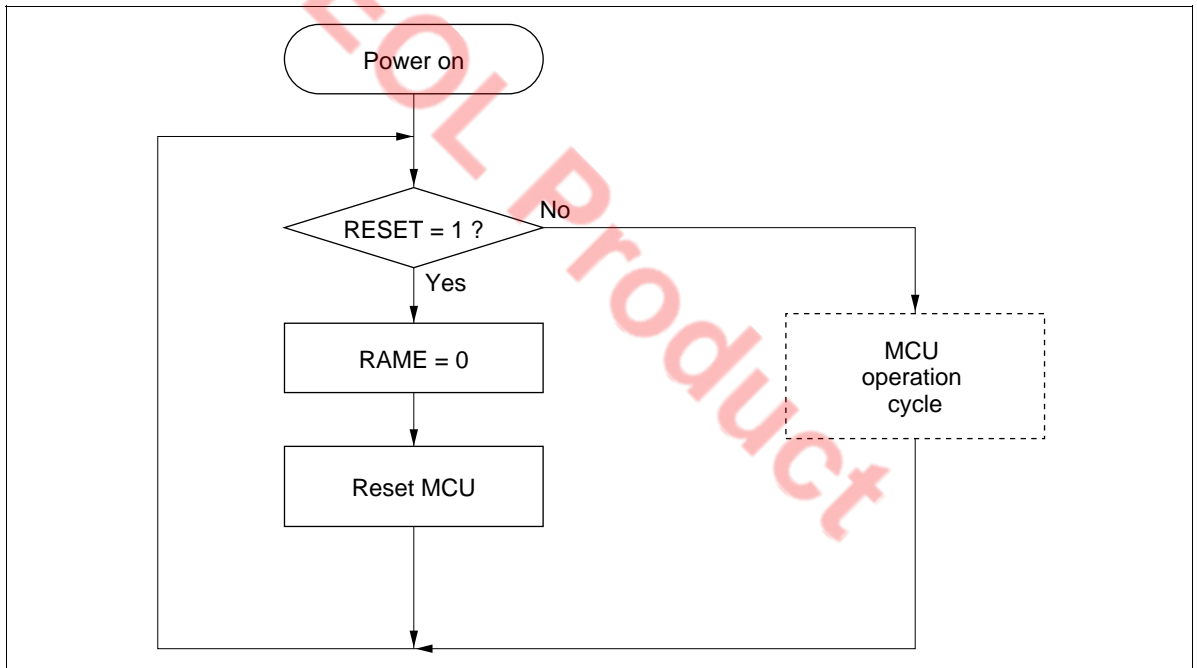

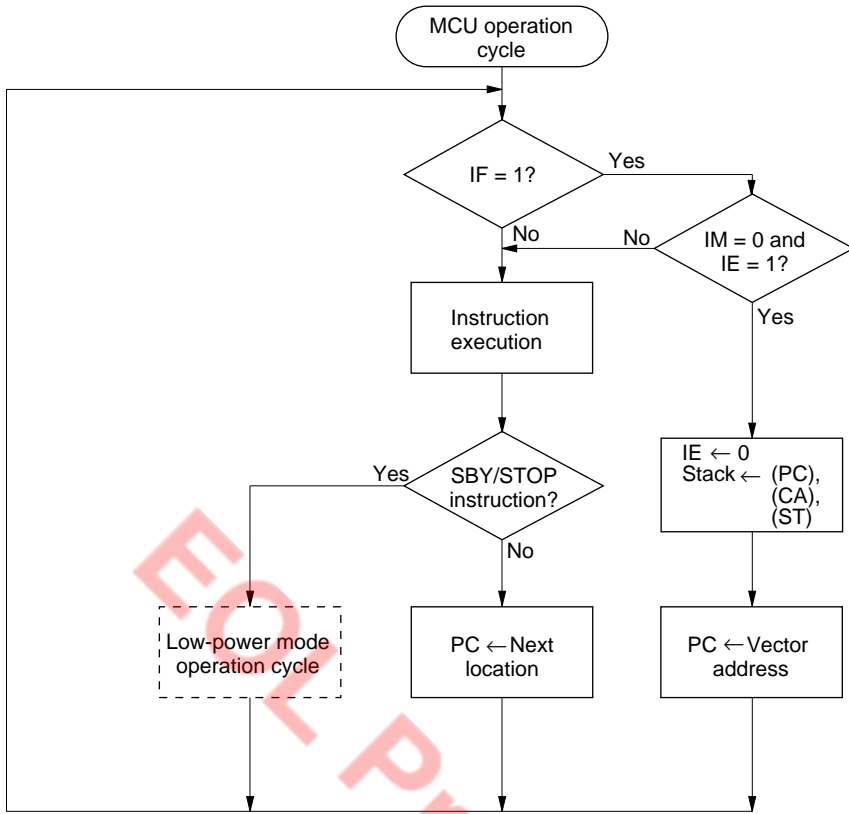

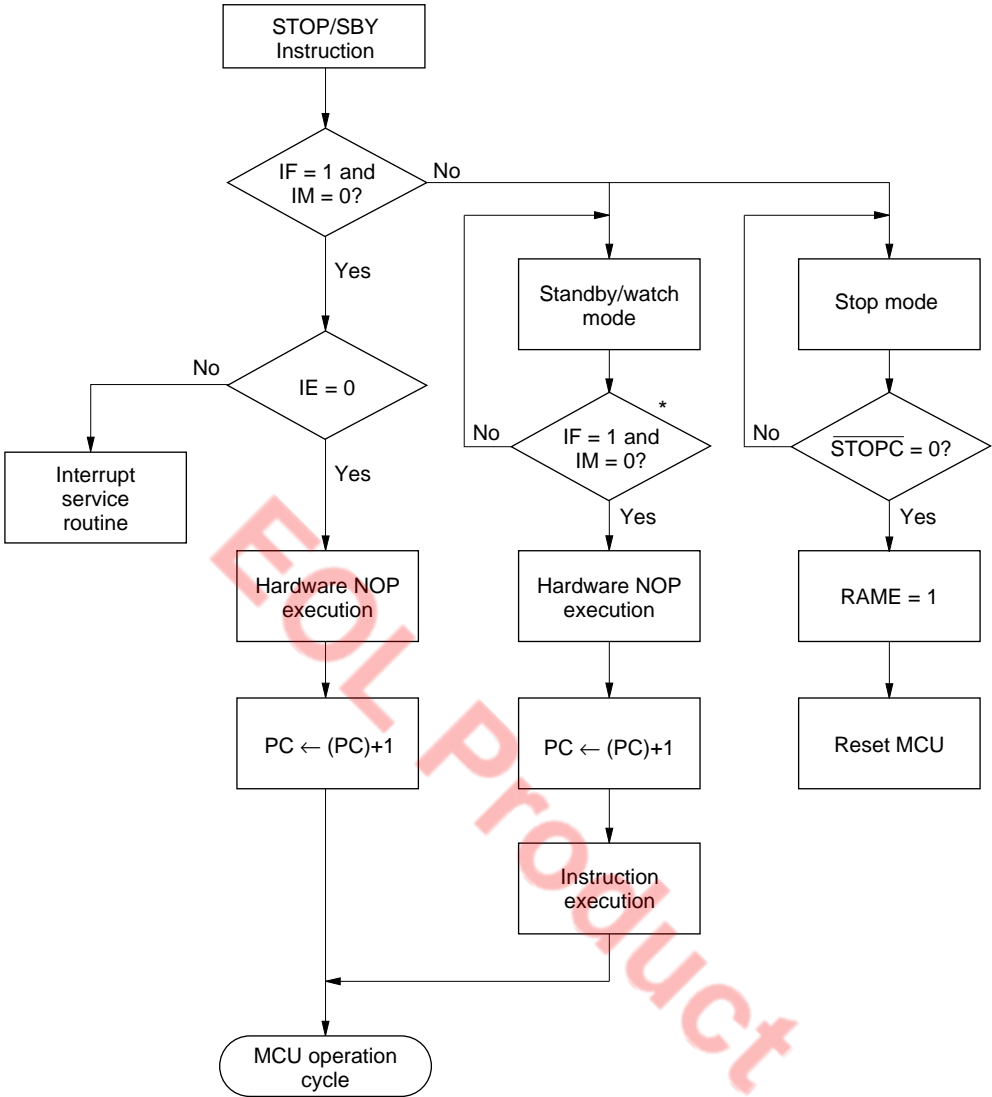

Figure 20 MCU Operating Sequence (Power On)

IF: Interrupt request flag
 IM: Interrupt mask
 IE: Interrupt enable flag
 PC: Program counter
 CA: Carry flag
 ST: Status flag

Figure 21 MCU Operating Sequence (MCU Operation Cycle)

Note: *Refer to figure 15, Flowchart for Exiting Low Power Modes, for IF and IM operation.

Figure 22 MCU Operating Sequence (Low-Power Mode Operation)

Notes: 1. When watch mode or subactive mode on HD404829R Series/HD4074829 is used and the LCD function is off in that mode, the watch mode or subactive mode current is larger, and consequently the following settings should be made.

Perform the following writes in the order shown before the transition to watch mode (before execution of the STOP instruction):

Write \$0 to LCR
Write \$3 to LMR

Also, when returning to active mode from watch mode or subactive mode, perform the following writes in the order shown:

Write a value appropriate to the conditions of use to LMR
Write a value appropriate to the conditions of use to LCR

A sample programming flowchart for the above procedures is shown in figure 23.

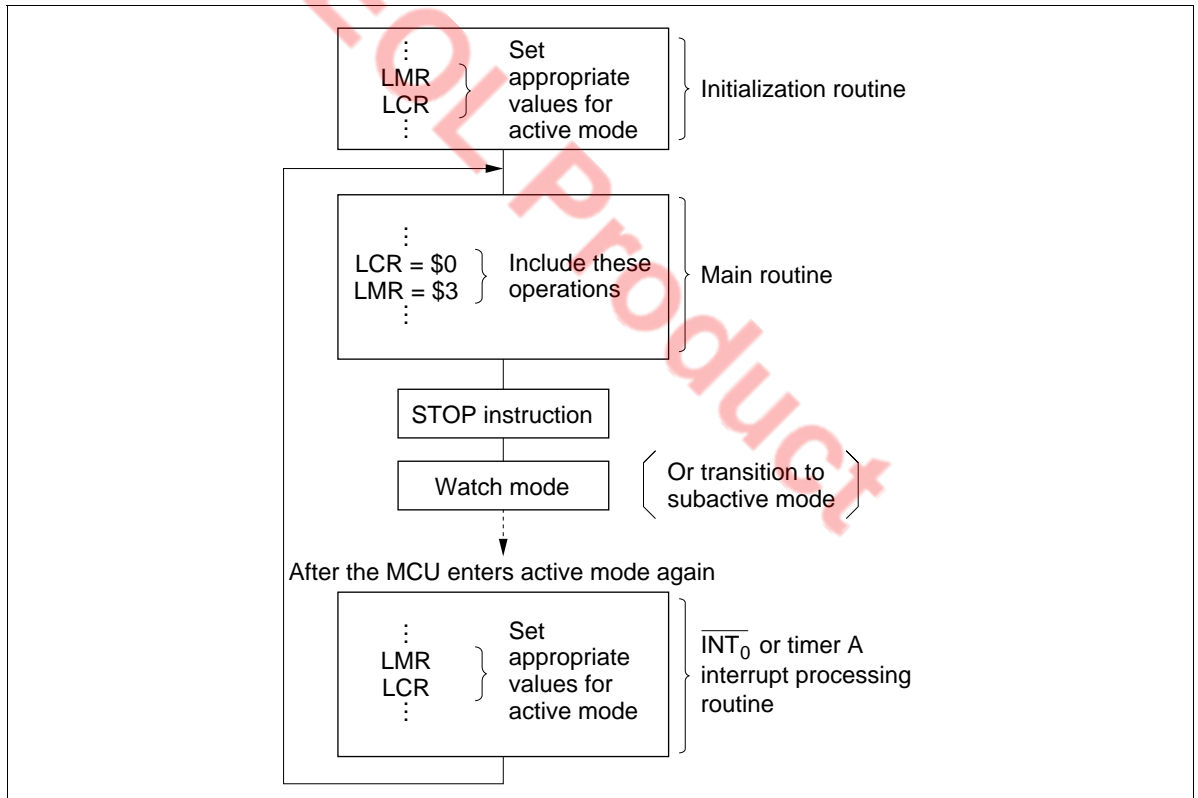

Figure 23 Programming Flowchart (LCD Display Off in Watch or Subactive Mode)

Notes: 2. When the MCU is in watch mode or subactive mode, if the high level period before the falling edge of $\overline{\text{INT}}_0$ is shorter than the interrupt frame, $\overline{\text{INT}}_0$ is not detected. Also, if the low level period after the falling edge of $\overline{\text{INT}}_0$ is shorter than the interrupt frame, $\overline{\text{INT}}_0$ is not detected.

Edge detection is shown in figure 24. The level of the $\overline{\text{INT}}_0$ signal is sampled by a sampling clock. When this sampled value changes to low from high, a falling edge is detected.

In figure 25, the level of the $\overline{\text{INT}}_0$ signal is sampled by an interrupt frame. In (a) the sampled value is low at point A, and also low at point B. Therefore, a falling edge is not detected. In (b), the sampled value is high at point A, and also high at point B. A falling edge is not detected in this case either.

When the MCU is in watch mode or subactive mode, keep the high level and low level period of $\overline{\text{INT}}_0$ longer than interrupt frame.

Figure 24 Edge Detection

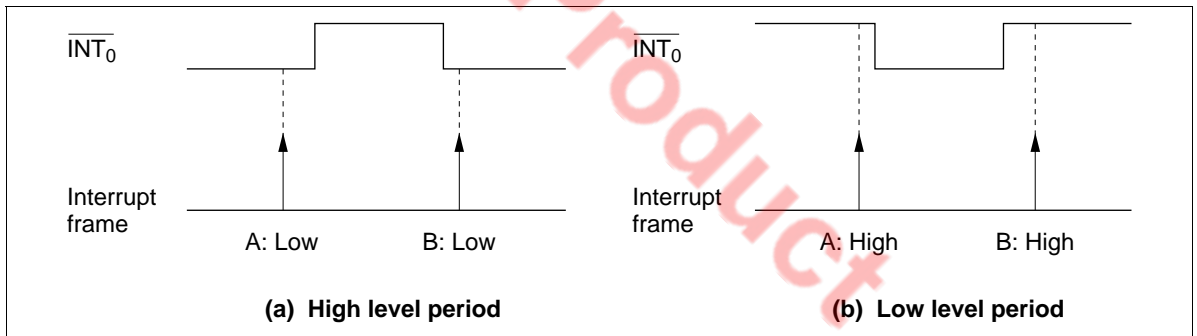

Figure 25 Sampling Example

Internal Oscillator Circuit

A block diagram of the clock generation circuit is shown in figure 26. As shown in table 16, a ceramic oscillator can be connected to OSC₁ and OSC₂, and a 32.768-kHz oscillator can be connected to X1 and X2. The system oscillator can also be operated by an external clock. Bit 1 (SSR1) of the system clock select register (SSR: \$029) must be set according to the frequency of the oscillator connected to OSC₁ and OSC₂ (figure 27).

Note: If the system clock select register (SSR: \$029) setting does not match the oscillator frequency, DTMF generator and subsystems using the 32.768-kHz oscillation will malfunction.

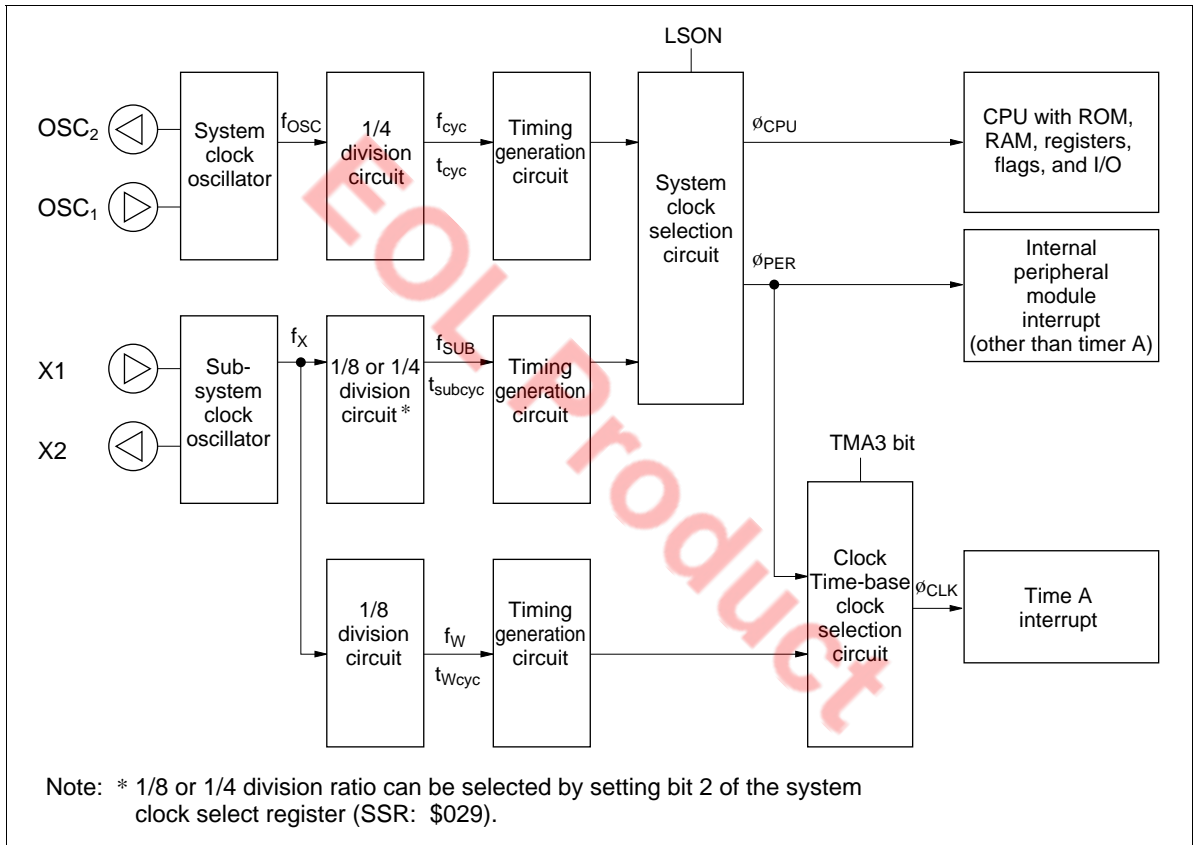

Figure 26 Clock Generation Circuit

System clock select register (SSR: \$029)

Bit	3	2	1	0
Initial value	0	0	—	—
Read/Write	W	W	—	—
Bit name	SSR3	SSR2	—	—

SSR3	32-kHz oscillation stop	SSR1	System clock selection
0	Oscillation operates in stop mode	0	$f_{OSC} = 400 \text{ kHz to } 1 \text{ MHz}$
1	Oscillation stops in stop mode	1	$f_{OSC} = 1.6 \text{ to } 4.2 \text{ MHz}$

SSR2	32-kHz oscillation division ratio selection
0	$f_{SUB} = f_X/8$
1	$f_{SUB} = f_X/4$

Note: SSR3 is cleared only by a RESET input. SSR3 will not be cleared by a STOPC input during stop mode, and will retain its value. SSR3 will also not be cleared upon entering stop mode.

Figure 27 System Clock Select Register (SSR)

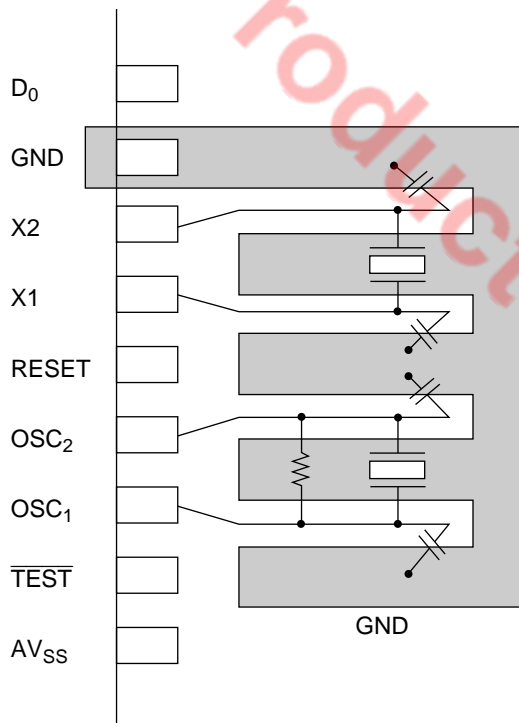

Figure 28 Typical Layouts of Crystal and Ceramic Oscillator

Table 16 Oscillator Circuit Examples

	Circuit Configuration	Circuit Constants

Crystal oscillator (X1, X2)		<p>Crystal oscillator: 32.768 kHz: MX38T (Nippon Denpa)</p> <p>$C_1 = C_2 = 20\text{ pF} \pm 20\%$ $R_s = 14\text{ k}\Omega$ $C_0 = 1.5\text{ pF}$</p>

- Notes:
1. Circuit constants differ by the different types of crystal oscillators, ceramic oscillators, and with the stray capacitance of the board, so consult the manufacturer of the oscillator to determine the circuit parameters.
 2. The wiring between the OSC₁, OSC₂ (X1 and X2 pins), and the other elements should be as short as possible, and must not cross other wiring. Refer to figure 28.
 3. If not using a 32.768-kHz crystal oscillator, fix the X1 pin to V_{CC} and leave the X2 pin open.

EOL Product

Input/Output

The MCU has 42 input/output pins (D₀–D₉, R₀–R₇₃) and 2 input pins (D₁₀, D₁₁). The features are described below.

- Ten pins (D₀–D₉) are high-current input/output pins.
- The D₁₀ and D₁₁, and R₀–R₇₃ input/output pins are multiplexed with peripheral function pins such as for the timers or serial interface. For these pins, the peripheral function setting is done prior to the D or R port setting. Therefore, when a peripheral function is selected for a pin, the pin function and input/output selection are automatically switched according to the setting.
- Input or output selection for input/output pins and port or peripheral function selection for multiplexed pins are set by software.
- Peripheral function output pins are CMOS output pins. Only the R₂₃/SO pin can be set to NMOS open-drain output by software.
- In stop mode, the MCU is reset, and therefore peripheral function selection is cancelled. Input/output pins are in high-impedance state.
- Each input/output pin has a built-in pull-up MOS, which can be individually turned on or off by software.

I/O buffer configuration is shown in figure 29, programmable I/O circuits are listed in table 17, and I/O pin circuit types are shown in table 18.

Table 18 Circuit Configurations of I/O Pins (cont)

I/O Pin Type	Circuit	Pins
Peripheral function pins		SCK
Output pins		SO
Input pins		TOB, TOC, TOD
Input pins		SI, \overline{INT}_1 , INT ₂ , INT ₃ , INT ₄ , EVNB, EVND
Input pins		\overline{INT}_0 , \overline{STOPC}

- Notes: 1. The MCU is reset in stop mode, and peripheral function selection is cancelled. The \overline{HLT} signal becomes low, and input/output pins enter high-impedance state.
 2. The \overline{HLT} signal is 1 in watch and subactive modes.

D Port (D₀–D₁₁): Consist of 10 input/output pins and 2 input pins addressed by one bit. D₀–D₉ are high-current I/O pins, and D₁₀ and D₁₁ are input-only pins.

Pins D₀–D₉ are set by the SED and SEDD instructions, and reset by the RED and REDD instructions. Output data is stored in the port data register (PDR) for each pin. All pins D₀–D₁₁ are tested by the TD and TDD instructions.

The on/off statuses of the output buffers are controlled by D-port data control registers (DCD0–DCD2: \$02C–\$02E) that are mapped to memory addresses (figure 30).

Pins D₁₀ and D₁₁ are multiplexed with peripheral function pins $\overline{\text{STOPC}}$ and $\overline{\text{INT}}_0$, respectively. The peripheral function modes of these pins are selected by bits 2 and 3 (PMRC2, PMRC3) of port mode register C (PMRC: \$025) (figure 31).

R Ports (R₀–R₇): 32 input/output pins addressed in 4-bit units. Data is input to these ports by the LAR and LBR instructions, and output from them by the LRA and LRB instructions. Output data is stored in the port data register (PDR) for each pin. The on/off statuses of the output buffers of the R ports are controlled by R-port data control registers (DCR0–DCR7: \$030–\$037) that are mapped to memory addresses (figure 30).

Pins R₀–R₃ are multiplexed with peripheral pins $\overline{\text{INT}}_1$ – $\overline{\text{INT}}_4$, respectively. The peripheral function modes of these pins are selected by bits 0–3 (PMRB0–PMRB3) of port mode register B (PMRB: \$024) (figure 32).

Pins R₁₀–R₁₂ are multiplexed with peripheral pins TOB, TOC, and TOD, respectively. The peripheral function modes of these pins are selected by bits 0 and 1 (TMB20, TMB21) of timer mode register B2 (TMB2: \$013), bits 0–2 (TMC20–TMC22) of timer mode register C2 (TMC2: \$014), and bits 0–3 (TMD20–TMD23) of timer mode register D2 (TMD2: \$015) (figures 33, 34, and 35).

Pins R₁₃ and R₂₀ are multiplexed with peripheral pins $\overline{\text{EVNB}}$ and EVND, respectively. The peripheral function modes of these pins are selected by bits 0 and 1 (PMRC0, PMRC1) of port mode register C (PMRC: \$025) (figure 31).

Pins R₂₁–R₂₃ are multiplexed with peripheral pins $\overline{\text{SCK}}$, SI, and SO, respectively. The peripheral function modes of these pins are selected by bit 3 (SMRA3) of serial mode register A (SMRA: \$005), and bits 0 and 1 (PMRA0, PMRA1) of port mode register A (PMRA: \$004), as shown in figures 36 and 37.

Ports R₃ and R₄ are multiplexed with segment pins SEG1–SEG8, respectively. The function modes of these pins can be selected by individual pins, by setting LCD output registers 1 and 2 (LOR1, LOR2: \$01D, \$01F) (figures 38 and 39).

Ports R₅–R₇ are multiplexed with segment pins SEG9–SEG20, respectively. The function modes of these pins can be selected in 4-pin units by setting LCD output register 3 (LOR3: \$01F) (figure 40).

Pull-Up MOS Transistor Control: A program-controlled pull-up MOS transistor is provided for each input/output pin other than input-only pins D₁₀ and D₁₁. The on/off status of all these transistors is controlled by bit 3 (MIS3) of the miscellaneous register (MIS: \$00C), and the on/off status of an individual transistor can also be controlled by the port data register (PDR) of the corresponding pin—enabling on/off control of that pin alone (table 17 and figure 41).

The on/off status of each transistor and the peripheral function mode of each pin can be set independently.

How to Deal with Unused I/O Pins: I/O pins that are not needed by the user system (floating) must be connected to V_{CC} to prevent LSI malfunctions due to noise. These pins must either be pulled up to V_{CC} by their pull-up MOS transistors or by resistors of about 100 kΩ.

Figure 41 Miscellaneous Register (MIS)

Prescalers

The MCU has the following two prescalers, S and W.

The prescalers operating conditions are listed in table 19, and the prescalers output supply is shown in figure 42. The timers A–D input clocks except external events, the serial transmit clock except the external clock, and the LCD circuit operating clock are selected from the prescaler outputs, depending on corresponding mode registers.

Prescaler Operation

Prescaler S: 11-bit counter that inputs the system clock signal. After being reset to \$000 by MCU reset, prescaler S divides the system clock. Prescaler S keeps counting, except in watch and subactive modes and at MCU reset.

Prescaler W: Five-bit counter that inputs the X1 input clock signal (32-kHz crystal oscillation) divided by eight. After being reset to \$00 by MCU reset, prescaler W divides the input clock. Prescaler W can be reset by software.

Table 19 Prescaler Operating Conditions

Prescaler	Input Clock	Reset Conditions	Stop Conditions
Prescaler S	System clock (in active and standby mode), Subsystem clock (in subactive mode)	MCU reset	MCU reset, stop mode, watch mode
Prescaler W	32-kHz crystal oscillation	MCU reset, software	MCU reset, stop mode

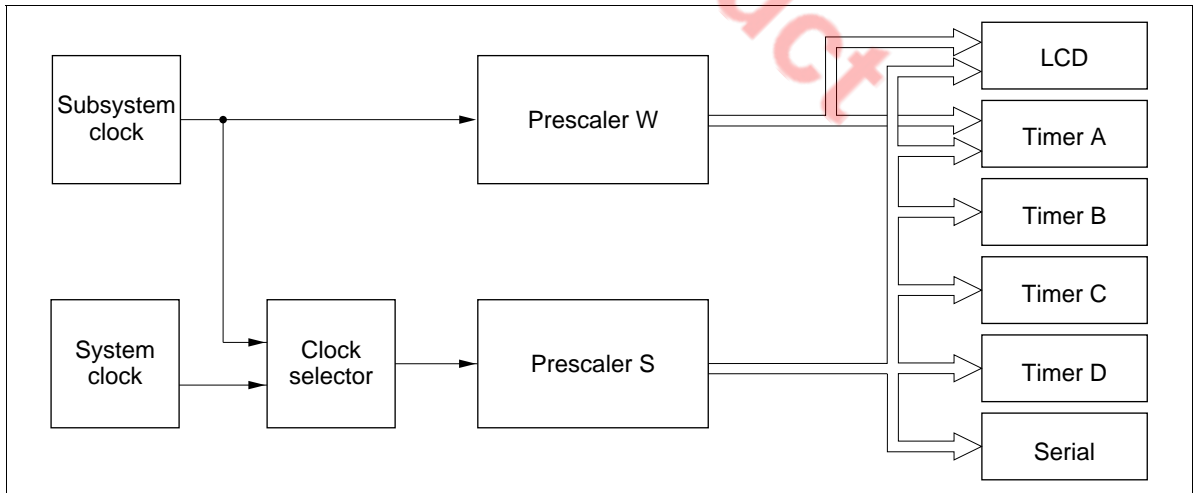

Figure 42 Prescaler Output Supply

Timers

The MCU has four timer/counters (A to D).

- Timer A: Free-running timer
- Timer B: Multifunction timer
- Timer C: Multifunction timer
- Timer D: Multifunction timer

Timer A is an 8-bit free-running timer. Timers B–D are 8-bit multifunction timers, whose functions are listed in table 20. The operating modes are selected by software.

Table 20 Timer Functions

Functions		Timer A	Timer B	Timer C	Timer D

	PWM	—	—	Available	Available

Note: — implies not available.

Timer A

Timer A Functions: Timer A has the following functions.

- Free-running timer
- Clock time-base

The block diagram of timer A is shown in figure 43.

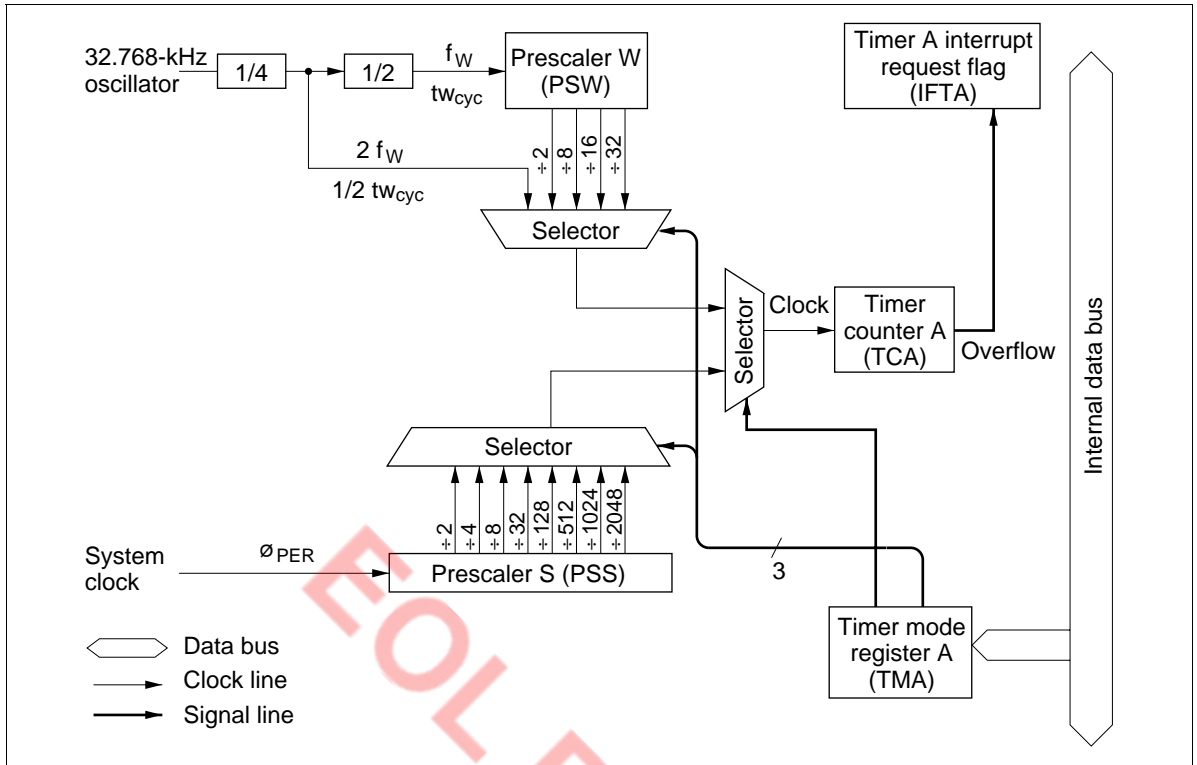

Figure 43 Block Diagram of Timer A

Timer A Operations:

- Free-running timer operation: The input clock for timer A is selected by timer mode register A (TMA: \$008).
- Timer A is reset to \$00 by MCU reset and incremented at each input clock. If an input clock is applied to timer A after it has reached \$FF, an overflow is generated, and timer A is reset to \$00. The overflow sets the timer A interrupt request flag (IFTA: \$001, bit 2). Timer A continues to be incremented after reset to \$00, and therefore it generates regular interrupts every 256 clocks.
- Clock time-base operation: Timer A is used as a clock time-base by setting bit 3 (TMA3) of timer mode register A (TMA: \$008) to 1. The prescaler W output is applied to timer A, and timer A generates interrupts at the correct timing based on the 32.768-kHz crystal oscillation. In this case, prescaler W and timer A can be reset to \$00 by software.

Registers for Timer A Operation: Timer A operating modes are set by the following registers.

- Timer mode register A (TMA: \$008): Four-bit write-only register that selects timer A’s operating mode and input clock source as shown in figure 44.

Timer mode register A (TMA: \$008)

	1	0	0	—	$1/2t_{Wcyc}$	
			1	—	Not used	
		1	X	—	Reset PSW and TCA	

X : Don't care

- Note:
- $t_{Wcyc} = 244.14 \mu s$ (when a 32.768-kHz crystal oscillator is used)
 - Timer counter overflow output period (seconds) = input clock period (seconds) \times 256.
 - If PSW of TCA reset is selected while the LCD is operating, LCD operation halts (power switch goes off and all SEG and COM pins are grounded).
When an LCD is connected for display, the PSW and TCA reset periods must be set in the program to the minimum.
 - The division ratio must not be modified during time-base mode operation, otherwise an overflow cycle error will occur.

Figure 44 Timer Mode Register A (TMA)

Timer B

Timer B Functions: Timer B has the following functions.

- Free-running/reload timer
- External event counter
- Timer output operation (toggle, 0, and 1 outputs)

The block diagram of timer B is shown in figure 45.

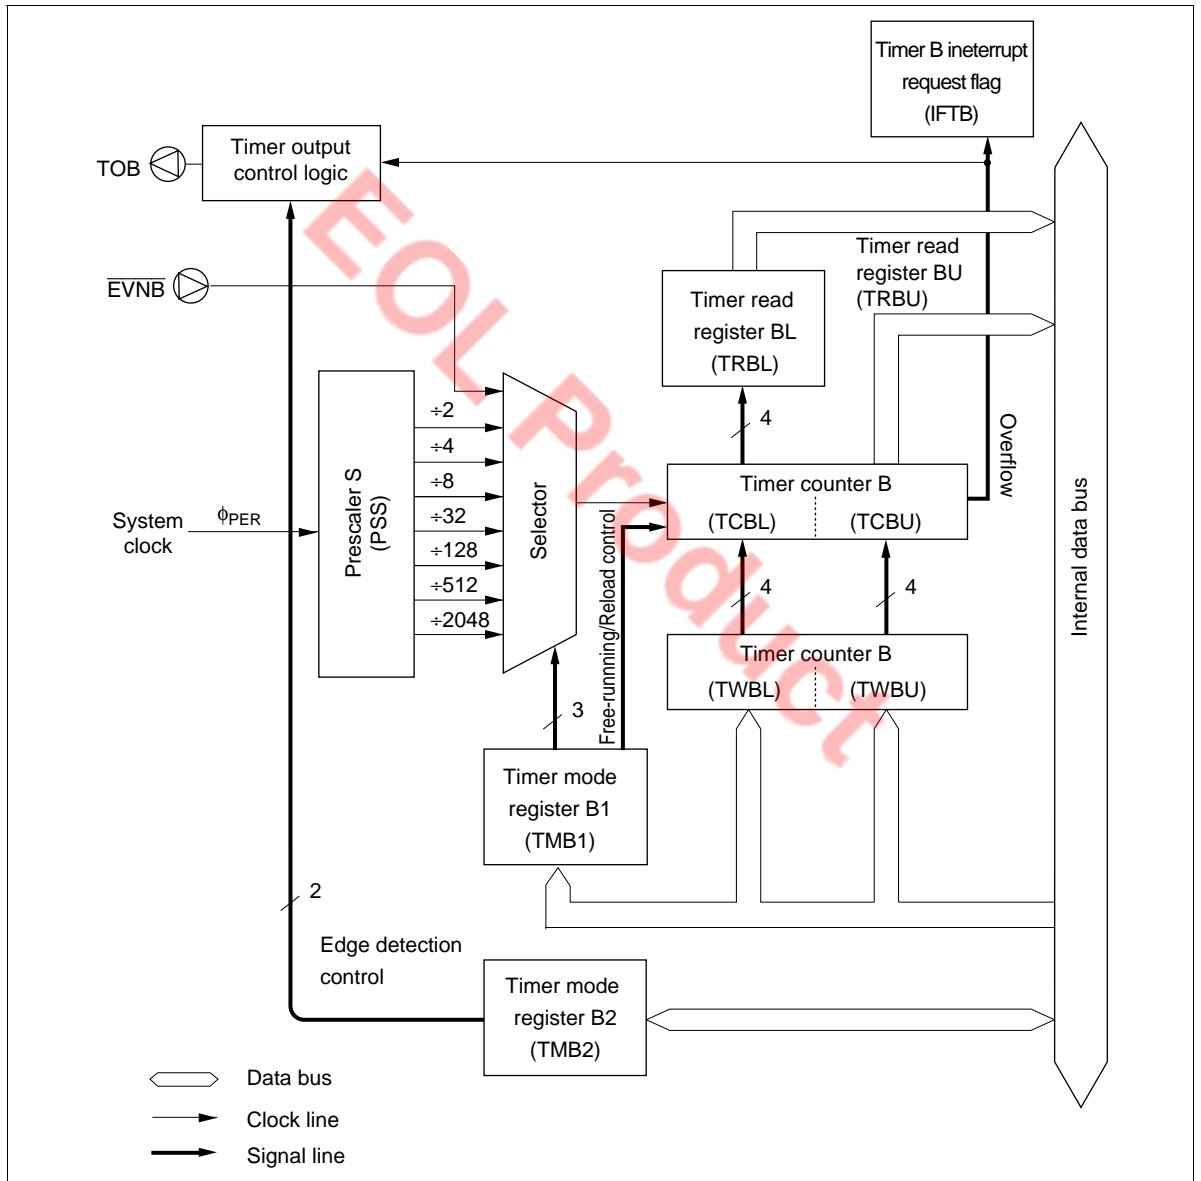

Figure 45 Block Diagram of Timer B

Timer B Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register B1 (TMB1: \$009).

Timer B is initialized to the value set in timer write register B (TWBL: \$00A, TWBU: \$00B) by software and incremented by one at each clock input. If an input clock is applied to timer B after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer B is initialized to its initial value set in timer write register B; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.

The overflow sets the timer B interrupt request flag (IFTB: \$002, bit 0). IFTB is reset by software or MCU reset. Refer to figure 3 and table 1 for details.

- External event counter operation: Timer B is used as an external event counter by selecting external event input as input clock source. In this case, pin R1₃ $\overline{\text{EVNB}}$ must be set to $\overline{\text{EVNB}}$ by port mode register C (PMRC: \$025).

Timer B is incremented by one at each falling edge of signals input to pin $\overline{\text{EVNB}}$. The other operation is basically the same as the free-running/reload timer operation.

- Timer output operation: The following three output modes can be selected for timer B by setting timer mode register B2 (TMB2: \$013).

Toggle

0 output

1 output

By selecting the timer output mode, pin R1₀/TOB is set to TOB. The output from TOB is reset low by MCU reset.

— Toggle output: When toggle output mode is selected, the output level is inverted if a clock is input after timer B has reached \$FF. By using this function and reload timer function, clock signals can be output at a required frequency for the buzzer. The output waveform is shown in figure 46.

— 0 output: When 0 output mode is selected, the output level is pulled low if a clock is input after timer B has reached \$FF. Note that this function must be used only when the output level is high.

— 1 output: When 1 output mode is selected, the output level is set high if a clock is input after timer B has reached \$FF. Note that this function must be used only when the output level is low.

Toggle output waveform (timers B, C, and D)

PWM output waveform (timers C and D)

Note: The waveform is always fixed low when $N = \$FF$.
 T: Input clock period to counter (figures 52 and 60)
 N: The value of the timer write register

Figure 46 Timer Output Waveform

Registers for Timer B Operation: By using the following registers, timer B operation modes are selected and the timer B count is read and written.

- Timer mode register B1 (TMB1: \$009)
- Timer mode register B2 (TMB2: \$013)
- Timer write register B (TWBL: \$00A, TWBU: \$00B)
- Timer read register B (TRBL: \$00A, TRBU: \$00B)
- Port mode register C (PMRC: \$025)

- Timer mode register B1 (TMB1: \$009):

Four-bit write-only register that selects the free-running/reload timer function, input clock source, and the prescaler division ratio as shown in figure 47. It is reset to \$0 by MCU reset.

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register B1 write instruction. Setting timer B's initialization by writing to timer write register B (TWBL: \$00A, TWBU: \$00B) must be done after a mode change becomes valid.

Timer mode register B1 (TMB1: \$009)					
Bit	3	2	1	0

Figure 48 Timer Mode Register B2 (TMB2)

- Timer mode register B2 (TMB2: \$013): Two-bit read/write register that selects the timer B output mode as shown in figure 48. It is reset to \$0 by MCU reset.
- Timer write register B (TWBL: \$00A, TWBU: \$00B): Write-only register consisting of the lower digit (TWBL) and the upper digit (TWBU) as shown in figures 49 and 50. The lower digit is reset to \$0 by MCU reset, but the upper digit value is invalid.

Timer B is initialized by writing to timer write register B. In this case, the lower digit (TWBL) must be written to first, but writing only to the lower digit does not change the timer B value. Timer B is initialized to the value in timer write register B at the same time the upper digit (TWBU) is written to. When timer write register B is written to again and if the lower digit value needs no change, writing only to the upper digit initializes timer B.

Timer C

Timer C Functions: Timer C has the following functions.

- Free-running/reload timer
- Watchdog timer
- Timer output operation (toggle, 0, 1, and PWM outputs)

The block diagram of timer C is shown in figure 54.

EOL Product

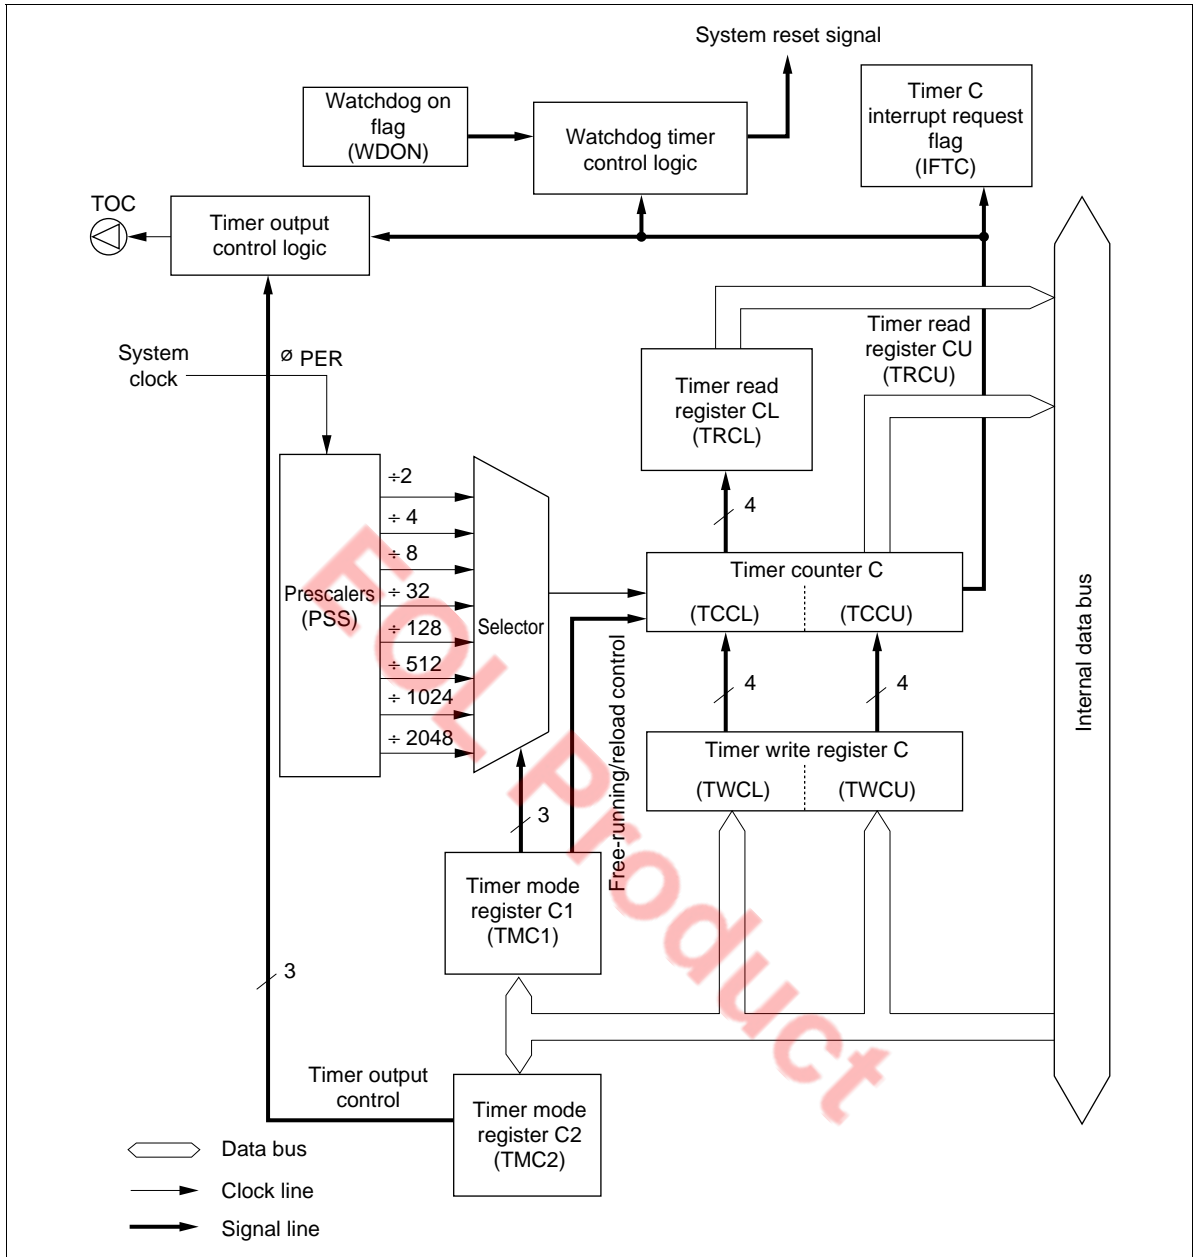

Figure 54 Block Diagram of Timer C

Timer C Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register C1 (TMC1: \$00D).

Timer C is initialized to the value set in timer write register C (TWCL: \$00E, TWCU: \$00F) by software and incremented by one at each clock input. If an input clock is applied to timer C after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer C is initialized to its initial value set in timer write register C; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.

The overflow sets the timer C interrupt request flag (IFTC: \$002, bit 2). IFTC is reset by software or MCU reset. Refer to figure 3 and table 1 for details.

- Watchdog timer operation: Timer C is used as a watchdog timer for detecting out-of-control program routines by setting the watchdog on flag (WDON: \$020, bit 1) to 1. If a program routine runs out of control and an overflow is generated, the MCU is reset. Program run can be controlled by initializing timer C by software before it reaches \$FF.
- Timer output operation: The following four output modes can be selected for timer C by setting timer mode register C2 (TMC2: \$014).

- Toggle
- 0 output
- 1 output
- PWM output

By selecting the timer output mode, pin R1₁/TOC is set to TOC. The output from TOC is reset low by MCU reset.

- Toggle output: The operation is basically the same as that of timer-B's toggle output.
- 0 output: The operation is basically the same as that of timer-B's 0 output.
- 1 output: The operation is basically the same as that of timer-B's 1 output.
- PWM output: When PWM output mode is selected, timer C provides the variable-duty pulse output function. The output waveform differs depending on the contents of timer mode register C1 (TMC1: \$00D) and timer write register C (TWCL: \$00E, TWCU: \$00F). The output waveform is shown in figure 46.

Registers for Timer C Operation: By using the following registers, timer C operation modes are selected and the timer C count is read and written.

- Timer mode register C1 (TMC1: \$00D)
- Timer mode register C2 (TMC2: \$014)
- Timer write register C (TWCL: \$00E, TWCU: \$00F)
- Timer read register C (TRCL: \$00E, TRCU: \$00F)

- **Timer mode register C1 (TMC1: \$00D):** Four-bit write-only register that selects the free-running/reload timer function, input clock source, and the prescaler division ratio as shown in figure 55. It is reset to \$0 by MCU reset.

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register C1 write instruction. Setting timer C's initialization by writing to timer write register C (TWCL: \$00E, TWCU: \$00F) must be done after a mode change becomes valid.

Figure 55 Timer Mode Register C1 (TMC1)

- Timer mode register C2 (TMC2: \$014): Three-bit read/write register that selects the timer C output mode as shown in figure 56. It is reset to \$0 by MCU reset.
- Timer write register C (TWCL: \$00E, TWCU: \$00F): Write-only register consisting of the lower digit (TWCL) and the upper digit (TWCU). The operation of timer write register C is basically the same as that of timer write register B (TWBL: \$00A, TWBU: \$00B).
- Timer read register C (TRCL: \$00E, TRCU: \$00F): Read-only register consisting of the lower digit (TRCL) and the upper digit (TRCU) that holds the count of the timer C upper digit. The operation of timer read register C is basically the same as that of timer read register B (TRBL: \$00A, TRBU: \$00B).

Timer D

Timer D Functions: Timer D has the following functions.

- Free-running/reload timer
- External event counter
- Timer output operation (toggle, 0, 1, and PWM outputs)
- Input capture timer

The block diagram for each operation mode of timer D is shown in figures 61 and 62.

Timer D Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register D1 (TMD1: \$010).

Timer D is initialized to the value set in timer write register D (TWDL: \$011, TWDU: \$012) by software and incremented by one at each clock input. If an input clock is applied to timer D after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer D is initialized to its initial value set in timer write register D; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.

The overflow sets the timer D interrupt request flag (IFTD: \$003, bit 0). IFTD is reset by software or MCU reset. Refer to figure 3 and table 1 for details.

- External event counter operation: Timer D is used as an external event counter by selecting the external event input as an input clock source. In this case, pin R2₀/EVND must be set to EVND by port mode register C (PMRC: \$025).

Either falling or rising edge, or both falling and rising edges of input signals can be selected as the external event detection edge by detection edge select register 2 (ESR2: \$027). When both rising and falling edges detection is selected, the time between the falling edge and rising edge of input signals must be $2t_{cyc}$ or longer.

Timer D is incremented by one at each detection edge selected by detection edge select register 2 (ESR2: \$027). The other operation is basically the same as the free-running/reload timer operation.

- Timer output operation: The following four output modes can be selected for timer D by setting timer mode register D2 (TMD2: \$015).

Toggle
0 output
1 output
PWM output

By selecting the timer output mode, pin R1₂/TOD is set to TOD. The output from TOD is reset low by MCU reset.

- Toggle output: The operation is basically the same as that of timer-B's toggle output.
- 0 output: The operation is basically the same as that of timer-B's 0 output.
- 1 output: The operation is basically the same as that of timer-B's 1 output.
- PWM output: The operation is basically the same as that of timer-C's PWM output.

- Input capture timer operation: The input capture timer counts the clock cycles between trigger edges input to pin EVND.

Either falling or rising edge, or both falling and rising edges of input signals can be selected as the trigger input edge by detection edge select register 2 (ESR2: \$027).

When a trigger edge is input to EVND, the count of timer D is written to timer read register D (TRDL: \$011, TRDU: \$012), and the timer D interrupt request flag (IFTD: \$003, bit 0) and the input capture status flag (ICSF: \$021, bit 0) are set. Timer D is reset to \$00, and then incremented again. While ICSF is set, if a trigger input edge is applied to timer D, or if timer D generates an overflow, the input capture error flag (ICEF: \$021, bit 1) is set. ICSF and ICEF are reset to 0 by MCU reset or by writing 0.

By selecting the input capture operation, pin R1₂/TOD is set to R1₂ and timer D is reset to \$00.

EOL Product

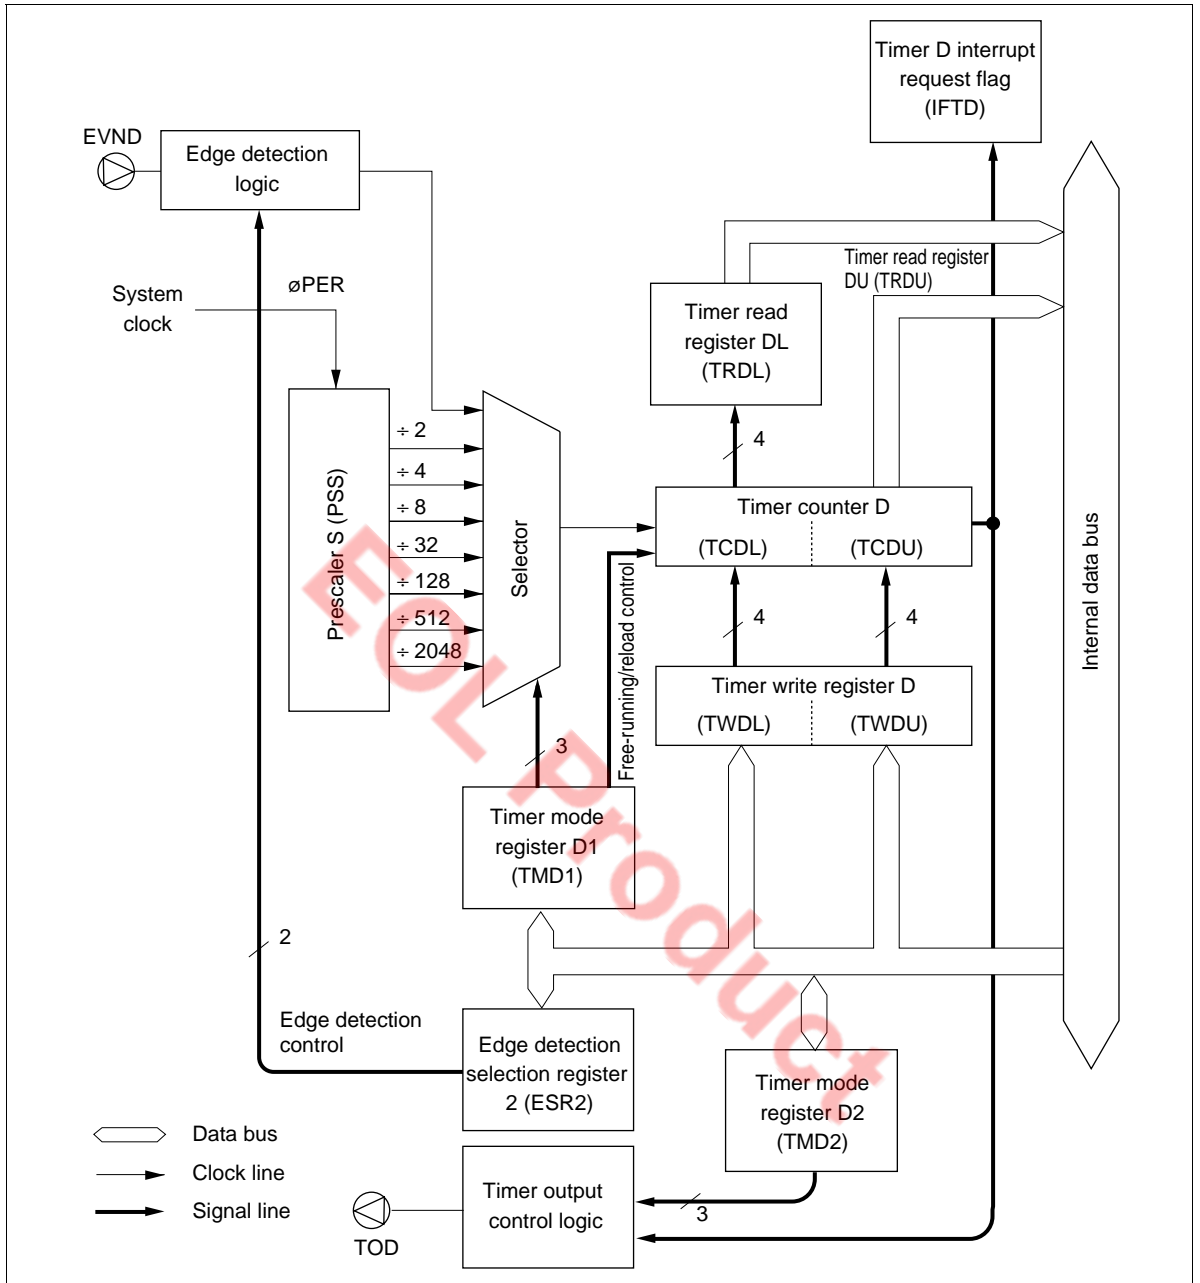

Figure 61 Block Diagram of Timer D (Free-Running/Reload Timer)

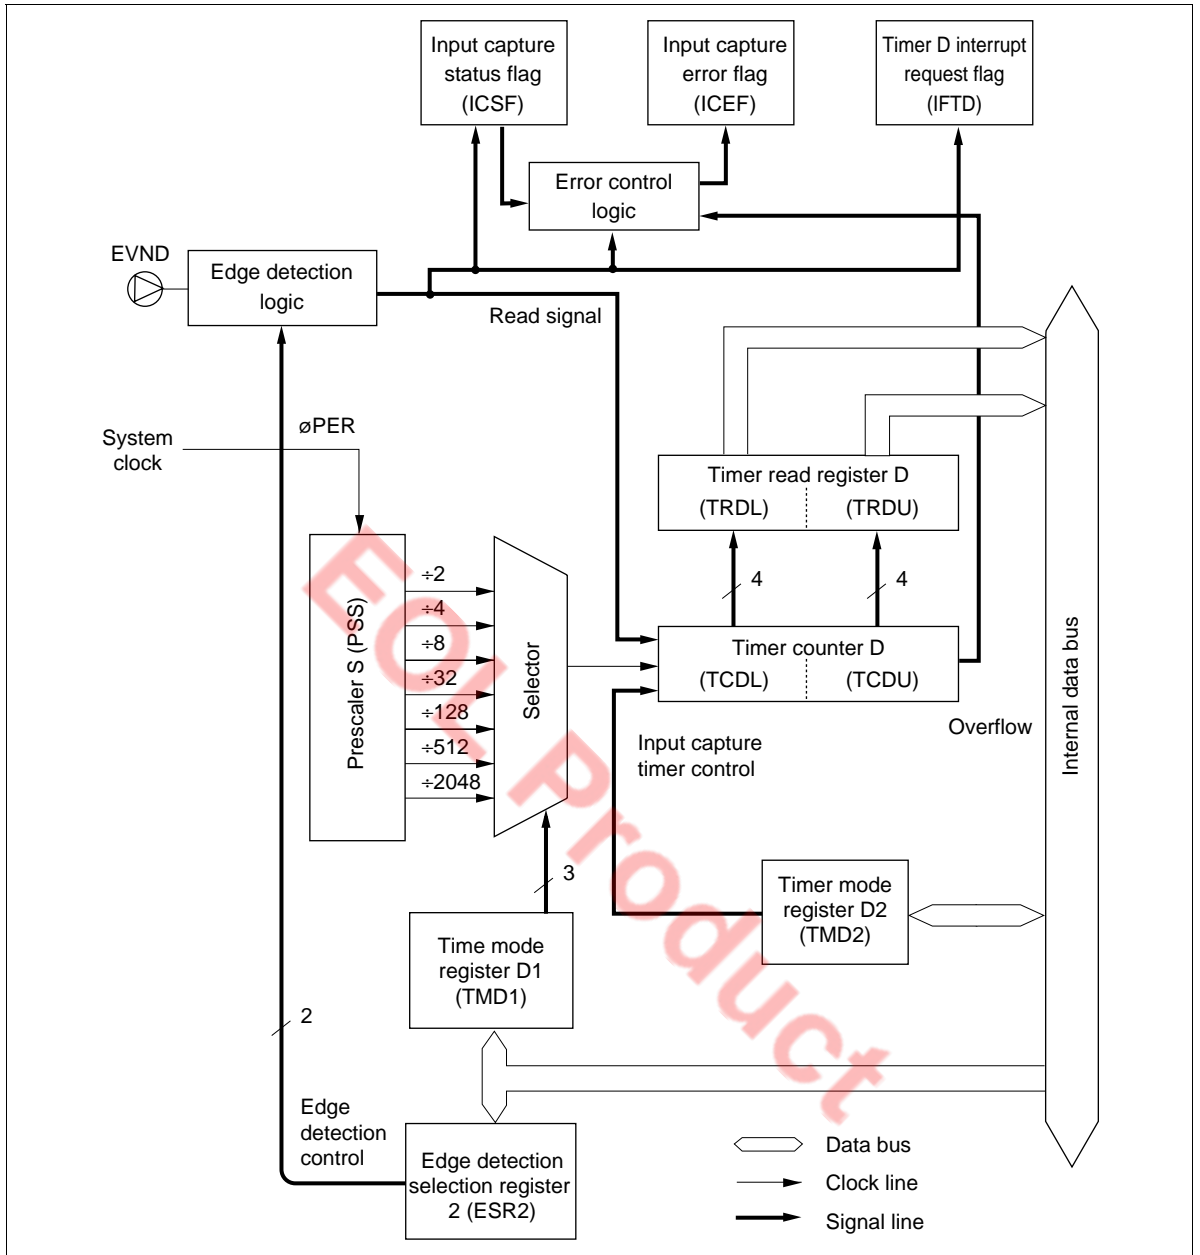

Figure 62 Block Diagram of Timer D (Input Capture Timer)

Registers for Timer D Operation: By using the following registers, timer D operation modes are selected and the timer D count is read and written.

- Timer mode register D1 (TMD1: \$010)
- Timer mode register D2 (TMD2: \$015)
- Timer write register D (TWDL: \$011, TWDU: \$012)
- Timer read register D (TRDL: \$011, TRDU: \$012)
- Port mode register C (PMRC: \$025)
- Detection edge select register 2 (ESR2: \$027)

- **Timer mode register D1 (TMD1: \$010):** Four-bit write-only register that selects the free-running/reload timer function, input clock source, and the prescaler division ratio as shown in figure 63. It is reset to \$0 by MCU reset.

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register D1 (TMD1: \$010) write instruction. Setting timer D’s initialization by writing to timer write register D (TWDL: \$011, TWDU: \$012) must be done after a mode change becomes valid.

When selecting the input capture timer operation, select the internal clock as the input clock source.

Note on Use

When using the timer output as PWM output, note the following point. From the update of the timer write register until the occurrence of the overflow interrupt, the PWM output differs from the period and duty settings, as shown in table 21. The PWM output should therefore not be used until after the overflow interrupt following the update of the timer write register. After the overflow, the PWM output will have the set period and duty cycle.

Table 21 PWM Output Following Update of Timer Write Register

Serial Interface

The serial interface serially transfers and receives 8-bit data, and includes the following features.

- Multiple transmit clock sources
 - External clock
 - Internal prescaler output clock
 - System clock
- Output level control in idle states

Five registers, an octal counter, and a multiplexer are also configured for the serial interface as follows.

Serial data register (SRL: \$006, SRU: \$007)

Serial mode register A (SMRA: \$005)

Serial mode register B (SMRB: \$028)

Miscellaneous register (MIS: \$00C)

Octal counter (OC)

Selector

The block diagram of the serial interface is shown in figure 70.

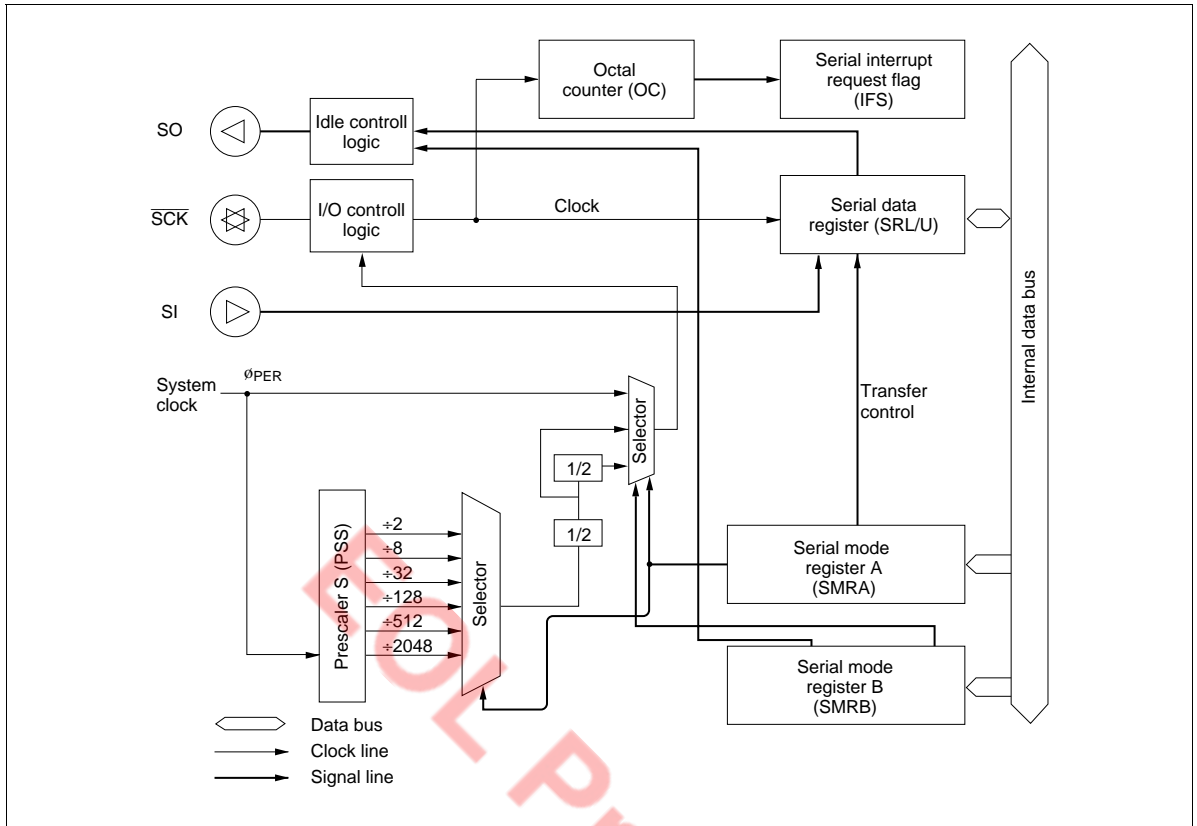

Figure 70 Block Diagram of Serial Interface

Serial Interface Operation

Selecting and Changing the Operating Mode: table 22 lists the serial interface’s operating modes. To select an operating mode, use one of these combinations of port mode register A (PMRA: \$004) and serial mode register A (SMRA: \$005) settings; to change the operating mode, always initialize the serial interface internally by writing data to serial mode register A. Note that the serial interface is initialized by writing data to serial mode register A. Refer to the following Serial Mode Register A section for details.

Pin Setting: The R2₁/SCK pin is controlled by writing data to serial mode register A (SMRA: \$005). The R2₂/SI and R2₃/SO pins are controlled by writing data to port mode register A (PMRA: \$004). Refer to the following Registers for Serial Interface section for details.

Transmit Clock Source Setting: The transmit clock source is set by writing data to serial mode register A (SMRA: \$005) and serial mode register B (SMRB: \$028). Refer to the following Registers for Serial Interface section for details.

Data Setting: Transmit data is set by writing data to the serial data register (SRL: \$006, SRU: \$007). Receive data is obtained by reading the contents of the serial data register. The serial data is shifted by the transmit clock and is input from or output to an external system.

The output level of the SO pin is invalid until the first data is output after MCU reset, or until the output level control in idle states is performed.

Table 22 Serial Interface Operating Modes

SMRA Bit 3	PMRA		Operating Mode
	Bit 1	Bit 0	
1	0	0	Continuous clock output mode
		1	Transmit mode
	1	0	Receive mode
		1	Transmit/receive mode

Transfer Control: The serial interface is activated by the STS instruction. The octal counter is reset to 000 by this instruction, and it increments at the rising edge of the transmit clock. When the eighth transmit clock signal is input or when serial transmission/receive is discontinued, the octal counter is reset to 000, the serial interrupt request flag (IFS: \$023, bit 2) is set, and the transfer stops.

When the prescaler output is selected as the transmit clock, the transmit clock frequency is selected as $4t_{cyc}$ to $8192t_{cyc}$ by setting bits 2 to 0 (SMRA2– SMRA0) of serial mode register A (SMRA: \$005) and bit 0 (SMRB0) of serial mode register B (SMRB: \$028) as listed in table 23.

Table 23 Serial Transmit Clock (Prescaler Output)

SMRB		SMRA		Prescaler Division Ratio	Transmit Clock Frequency
Bit 0	Bit 2	Bit 1	Bit 0		
0	0	0	0	÷ 2048	$4096t_{cyc}$
			1	÷ 512	$1024t_{cyc}$
		1	0	÷ 128	$256t_{cyc}$
			1	÷ 32	$64t_{cyc}$
	1	0	0	÷ 8	$16t_{cyc}$
			1	÷ 2	$4t_{cyc}$
1	0	0	0	÷ 4096	$8192t_{cyc}$
			1	÷ 1024	$2048t_{cyc}$
		1	0	÷ 256	$512t_{cyc}$
			1	÷ 64	$128t_{cyc}$
	1	0	0	÷ 16	$32t_{cyc}$
			1	÷ 4	$8t_{cyc}$

Operating States: The serial interface has the following operating states; transitions between them are shown in figure 71.

- STS wait state
- Transmit clock wait state
- Transfer state
- Continuous clock output state (only in internal clock mode)

- STS wait state: The serial interface enters STS wait state by MCU reset (00, 10 in figure 71). In STS wait state, the serial interface is initialized and the transmit clock is ignored. If the STS instruction is then executed (01, 11), the serial interface enters transmit clock wait state.
- Transmit clock wait state: Transmit clock wait state is between the STS execution and the falling edge of the first transmit clock. In transmit clock wait state, input of the transmit clock (02, 12) increments the octal counter, shifts the serial data register, and enters the serial interface in transfer state. However, note that if continuous clock output mode is selected in internal clock mode, the serial interface does not enter transfer state but enters continuous clock output state (17).

The serial interface enters STS wait state by writing data to serial mode register A (SMRA: \$005) (04, 14) in transmit clock wait state.

- Transfer state: Transfer state is between the falling edge of the first clock and the rising edge of the eighth clock. In transfer state, the input of eight clocks or the execution of the STS instruction sets the octal counter to 000, and the serial interface enters another state. When the STS instruction is executed (05, 15), transmit clock wait state is entered. When eight clocks are input, transmit clock wait state is entered (03) in external clock mode, and STS wait state is entered (13) in internal clock mode. In internal clock mode, the transmit clock stops after outputting eight clocks.

In transfer state, writing data to serial mode register A (SMRA: \$005) (06, 16) initializes the serial interface, and STS wait state is entered.

If the state changes from transfer to another state, the serial interrupt request flag (IFS: \$023, bit 2) is set by the octal counter that is reset to 000.

- Continuous clock output state (only in internal clock mode): Continuous clock output state is entered only in internal clock mode. In this state, the serial interface does not transmit/receive data but only outputs the transmit clock from the \overline{SCK} pin.

When bits 1 and 0 (PMRA1, PMRA0) of port mode register A (PMRA: \$004) are 00 in transmit clock wait state and if the transmit clock is input (17), the serial interface enters continuous clock output state. If serial mode register A (SMRA: \$005) is written to in continuous clock output mode (18), STS wait state is entered.

Figure 71 Serial Interface State Transitions

Output Level Control in Idle States: In idle states, that is, STS wait state and transmit clock wait state, the output level of the SO pin can be controlled by setting bit 1 (SMRB1) of serial mode register B (SMRB: \$028) to 0 or 1. The output level control example is shown in figure 72. Note that the output level cannot be controlled in transfer state.

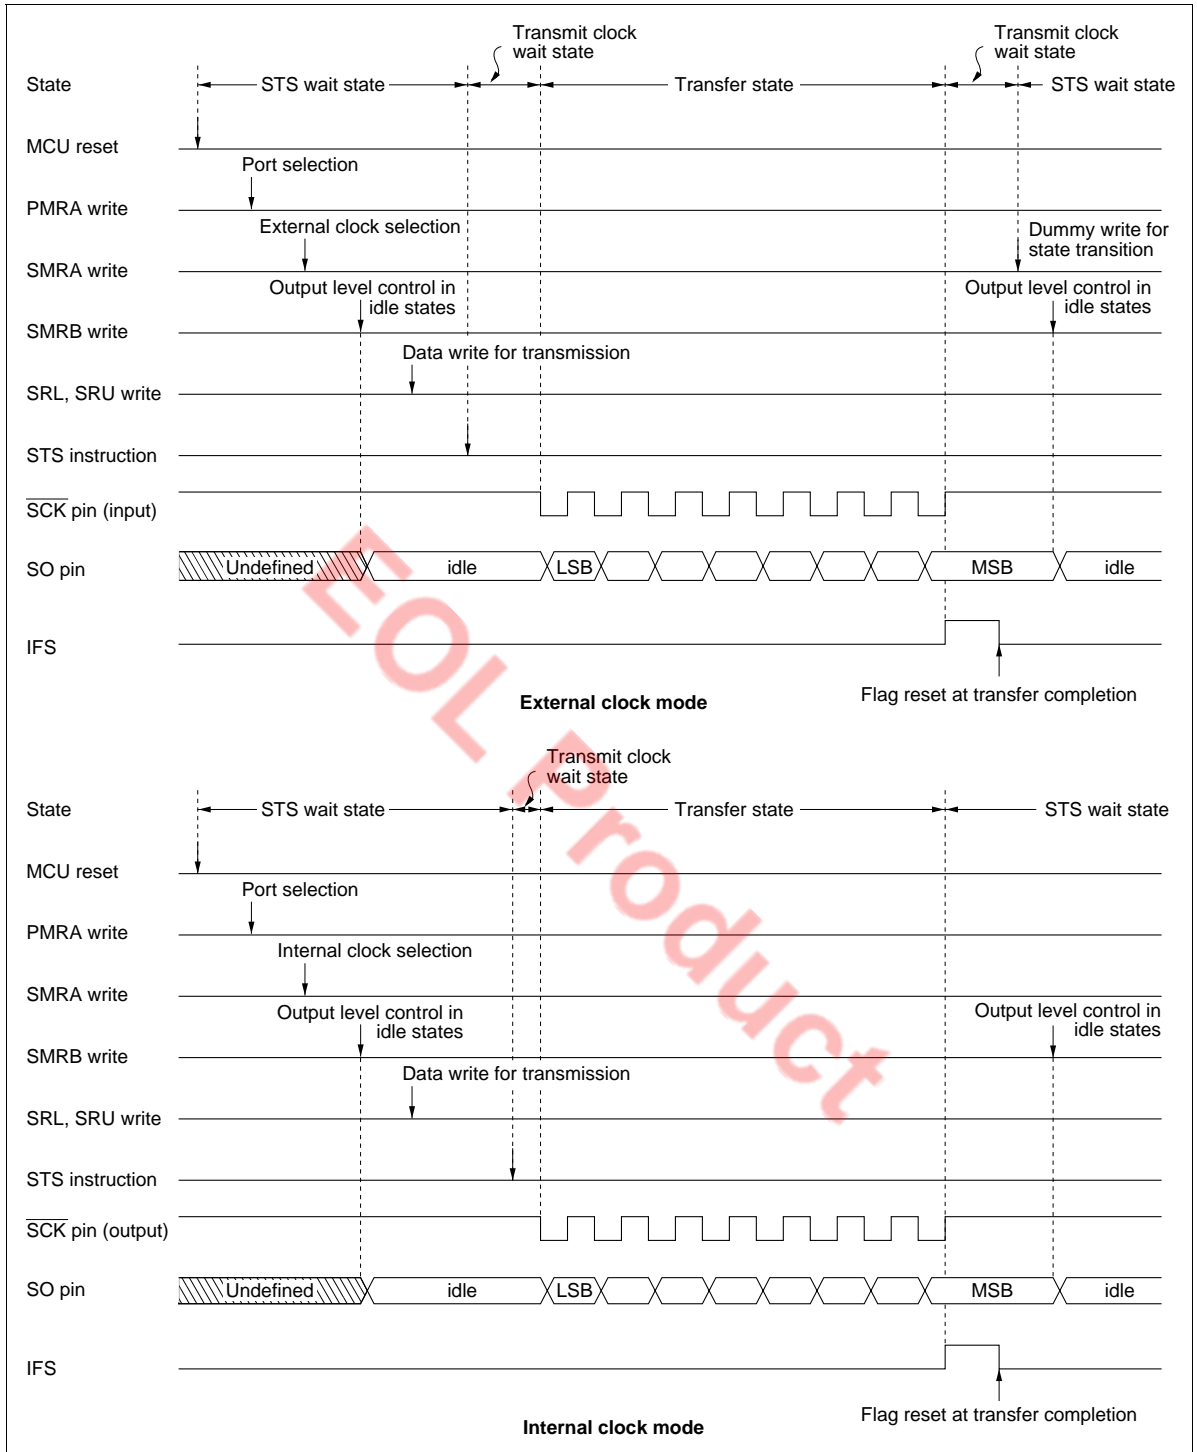

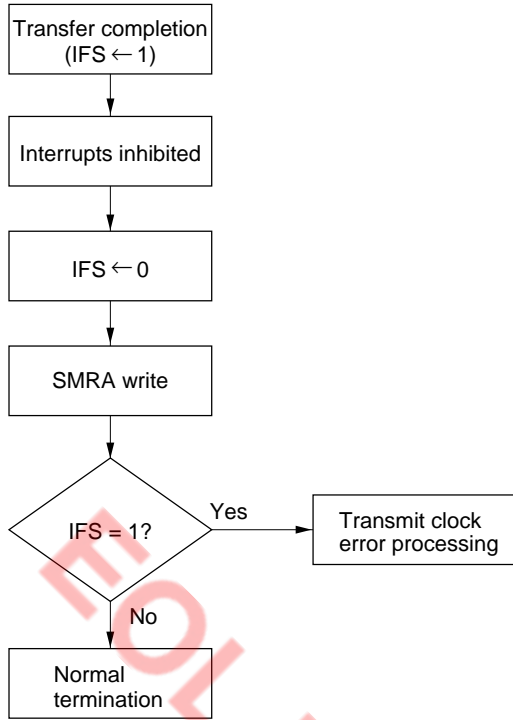

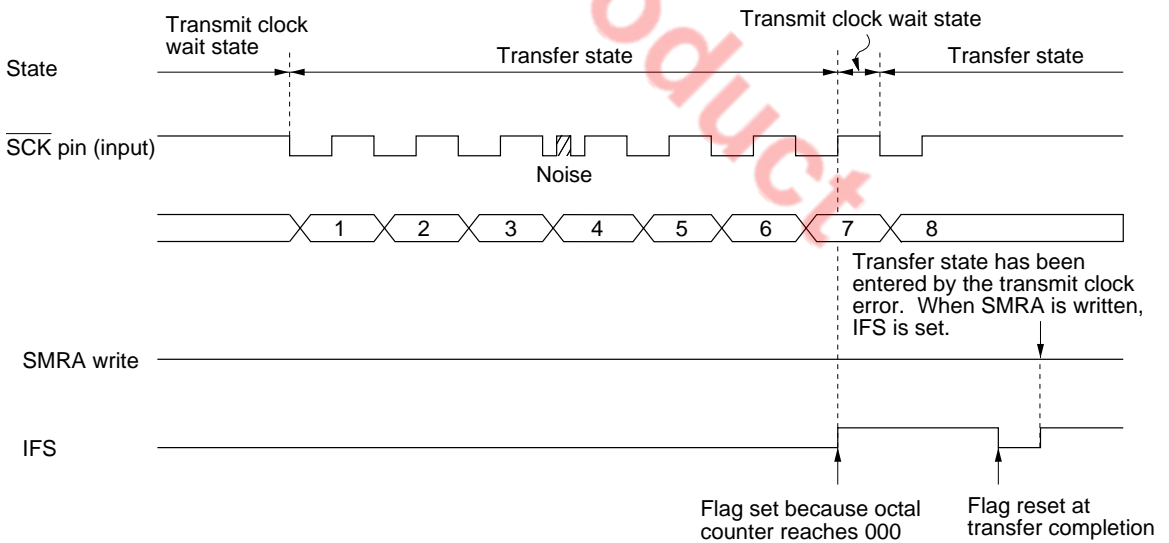

Figure 72 Example of Serial Interface Operation Sequence

Transmit clock error detection flowchart

Transmit clock error detection procedure

Figure 73 Transmit Clock Error Detection

Transmit Clock Error Detection (In External Clock Mode): The serial interface will malfunction if a spurious pulse caused by external noise conflicts with a normal transmit clock during transfer. A transmit clock error of this type can be detected as shown in figure 73.

If more than eight transmit clocks are input in transfer state, at the eighth clock including a spurious pulse by noise, the octal counter reaches 000, the serial interrupt request flag (IFS: \$023, bit 2) is set, and transmit clock wait state is entered. At the falling edge of the next normal clock signal, the transfer state is entered. After the transfer completion processing is performed and IFS is reset, writing to serial mode register A (SMRA: \$005) changes the state from transfer to STS wait. At this time IFS is set again, and therefore the error can be detected.

Notes on Use:

- Initialization after writing to registers: If port mode register A (PMRA: \$004) is written to in transmit clock wait state or in transfer state, the serial interface must be initialized by writing to serial mode register A (SMRA: \$005) again.
- Serial interrupt request flag (IFS: \$023, bit 2) set: If the state is changed from transfer to another by writing to serial mode register A (SMRA: \$005) or executing the STS instruction during the first low pulse of the transmit clock, the serial interrupt request flag is not set. To set the serial interrupt request flag, serial mode register A write or STS instruction execution must be programmed to be executed after confirming that the \overline{SCK} pin is at 1, that is, after executing the input instruction to port R2.

Registers for Serial Interface

The serial interface operation is selected, and serial data is read and written by the following registers.

Serial Mode Register A (SMRA: \$005)
Serial Mode Register B (SMRB: \$028)
Serial Data Register (SRL: \$006, SRU: \$007)
Port Mode Register A (PMRA: \$004)
Miscellaneous Register (MIS: \$00C)

Serial Mode Register A (SMRA: \$005): This register has the following functions (figure 74).

- $R2_1/\overline{SCK}$ pin function selection
- Transfer clock selection
- Prescaler division ratio selection
- Serial interface initialization

Serial mode register A (SMRA: \$005) is a 4-bit write-only register. It is reset to \$0 by MCU reset.

A write signal input to serial mode register A (SMRA: \$005) discontinues the input of the transmit clock to the serial data register and octal counter, and the octal counter is reset to 000. Therefore, if a write is performed during data transfer, the serial interrupt request flag (IFS: \$023, bit 2) is set.

Written data is valid from the second instruction execution cycle after the write operation, so the STS instruction must be executed at least two cycles after that.

Serial mode register A (SMRA: \$005)

Bit	3	2	1	0
Initial value	0	0	0	0

				1	Input	External clock	—

Figure 74 Serial Mode Register A (SMRA)

Serial Mode Register B (SMRB: \$028): This register has the following functions (figure 75).

- Prescaler division ratio selection
- Output level control in idle states

Serial mode register B is a 2-bit write-only register. It cannot be written during data transfer.

By setting bit 0 (SMRB0) of this register, the prescaler division ratio is selected. Only bit 0 (SMRB0) can be reset to 0 by MCU reset. By setting bit 1 (SMRB1), the output level of the SO pin is controlled in idle states. The output level changes at the same time that SMRB1 is written to.

Serial mode register B (SMRB: \$028)

0	Low level	0	Prescaler output divided by 2
1	High level	1	Prescaler output divided by 4

Figure 75 Serial Mode Register B (SMRB)

Serial Data Register (SRL: \$006, SRU: \$007): This register has the following functions (figures 76 and 77).

- Transmission data write and shift
- Receive data shift and read

Writing data in this register is output from the SO pin, LSB first, synchronously with the falling edge of the transmit clock; data is input, LSB first, through the SI pin at the rising edge of the transmit clock. Input/output timing is shown in figure 78.

Data cannot be read or written during serial data transfer. If a read/write occurs during transfer, the accuracy of the resultant data cannot be guaranteed.

A/D Converter

The MCU has a built-in A/D converter that uses a successive approximation method with a resistor ladder. It can measure four analog inputs with 8-bit resolution. As shown in the block diagram of figure 81, the A/D converter has a 4-bit A/D mode register, a 1-bit A/D start flag, and a 4-bit plus 4-bit A/D data register.

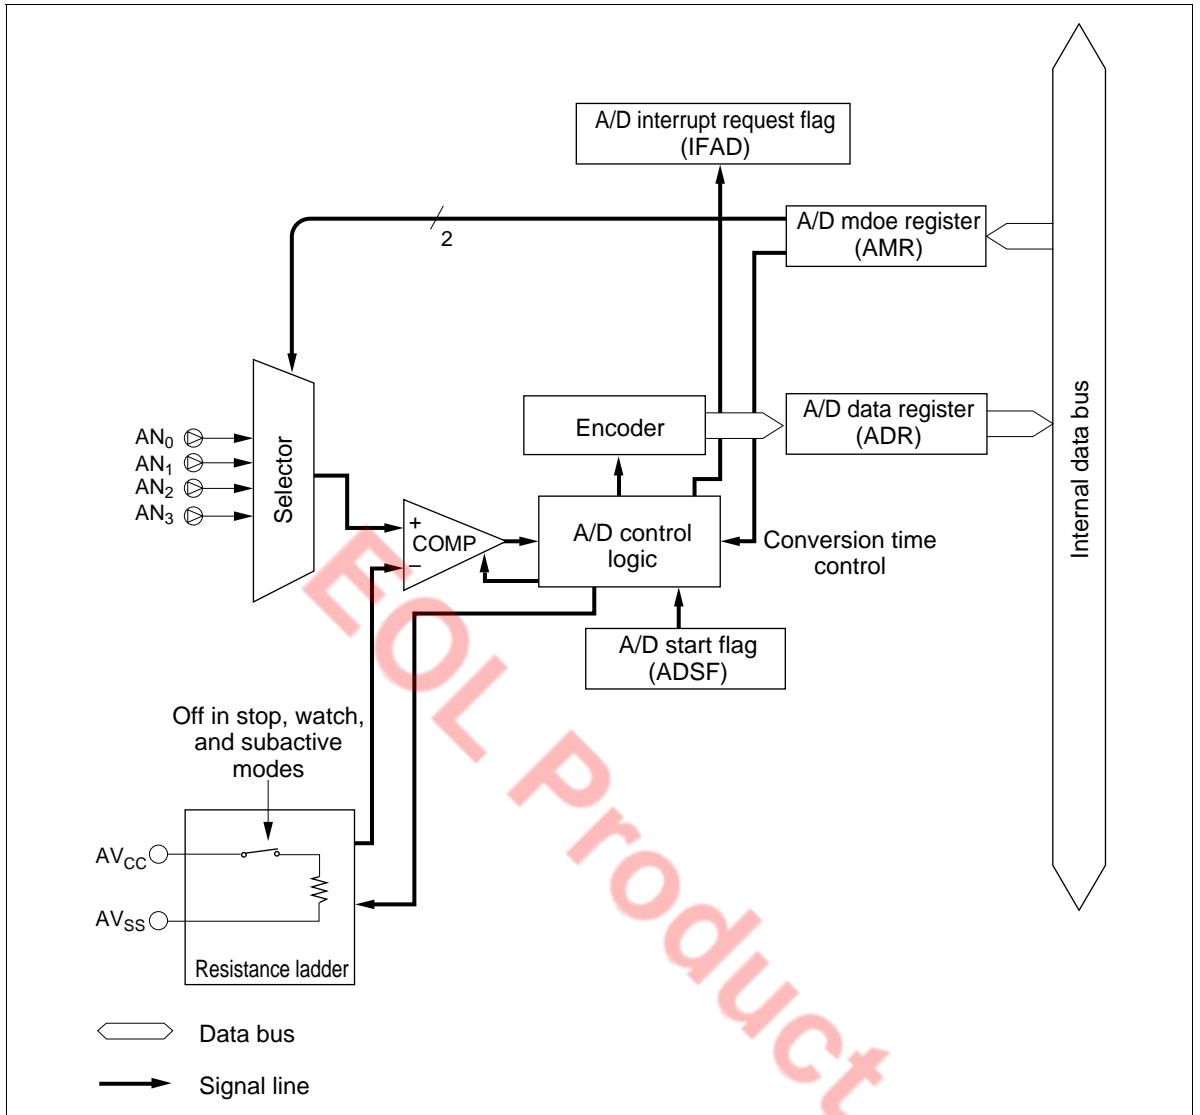

Figure 81 Block Diagram of A/D Converter

A/D Mode Register (AMR: \$016): Four-bit write-only register which selects the A/D conversion period and indicates analog input pin information. Bit 0 of the A/D mode register selects the A/D conversion period, and bits 3 and 2 select a channel, as shown in figure 82.

Figure 86 A/D Start Flag (ADSF)

Note on Use: Use the SEM and SEMD instructions to write data to the A/D start flag (ADSF: \$020, bit 2), but make sure that the A/D start flag is not written to during A/D conversion. Data read from the A/D data register (ADRL: \$017, ADRU: \$018) during A/D conversion cannot be guaranteed.

The A/D converter does not operate in the stop, watch, and subactive modes because of the OSC clock. During these low-power dissipation modes, current through the resistor ladder is cut off to decrease the power input.

EOL Product

LCD Controller/Driver

The MCU has an LCD controller and driver which drive 4 common signal pins and 52 segment pins. The controller consists of a RAM area in which display data is stored, a display control register (LCR: \$01B), and a duty-cycle/clock-control register (LMR: \$01C) (figure 87).

Four duty cycles and the LCD clock are programmable, and a built-in dual-port RAM ensures that display data can be automatically transmitted to the segment signal pins without program intervention. If a 32-kHz oscillation clock is selected as the LCD clock source, the LCD can even be used in watch mode, in which the system clock stops.

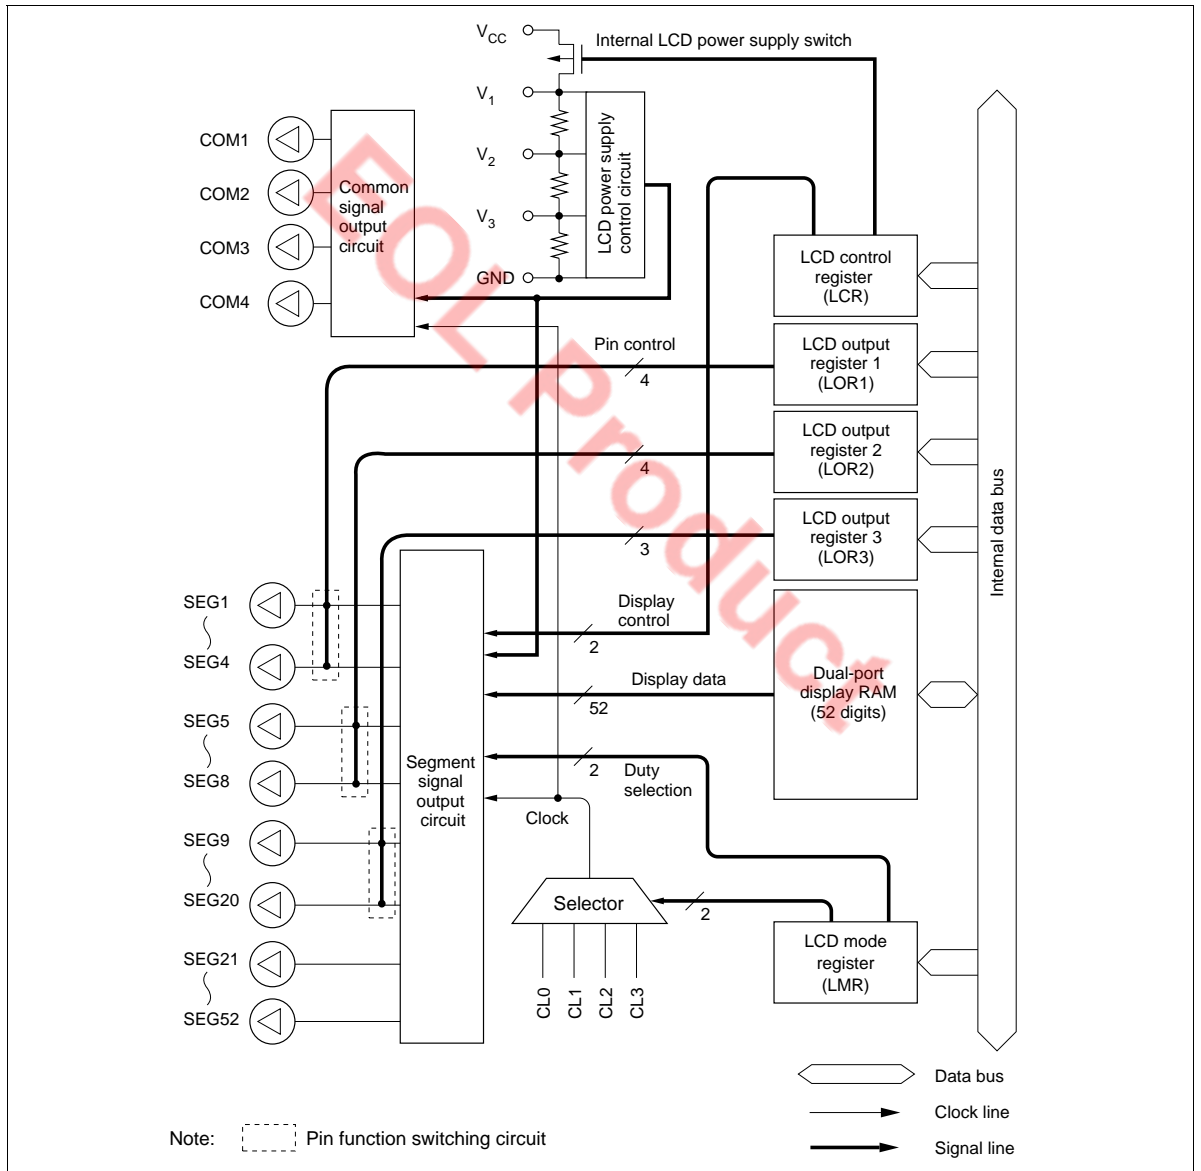

Figure 87 LCD Controller/Driver Block Diagram

LCD Data Area and Segment Data (\$050–\$083): As shown in figure 88, each bit of the storage area corresponds to one of four duty cycles. If data is written to an area corresponding to a certain duty cycle, it is automatically output to the corresponding segments as display data.

LCD Control Register (LCR: \$01B): Three-bit write-only register which controls LCD blanking, on/off switching of the liquid-crystal display's power supply division resistor, and display in watch and subactive modes, as shown in figure 89.

- Blank/display
 Blank: Segment signals are turned off, regardless of LCD RAM data setting.
 Display: LCD RAM data is output as segment signals.
- Power switch on/off
 Off: The power switch is off.
 On: The power switch is on and V_1 is V_{CC} .
- Watch/subactive mode display
 Off: In watch and subactive modes, all common and segment pins are grounded and the liquid-crystal power switch is turned off.
 On: In watch and subactive modes, LCD RAM data is output as segment signals.

Large Liquid-Crystal Panel Drive and V_{LCD} : To drive a large-capacity LCD, decrease the resistance of the built-in division resistors by attaching external resistors in parallel, as shown in figure 94.

The size of these resistors cannot be simply calculated from the LCD load capacitance because the matrix configuration of the LCD complicates the paths of charge/discharge currents flowing through the capacitors—the resistance will also vary with lighting conditions. This size must be determined by trial-and-error, taking into account the power dissipation of the device using the LCD, but a resistance of 1 to 10 k Ω would usually be suitable. (Another effective method is to attach capacitors of 0.1 to 0.3 μ F.)

Always turn off the power switch (set bit 1 of the LCR to 0) before changing the liquid-crystal drive voltage (V_{LCD}).

$V_{CC} \geq V_{LCD} \geq GND$

Programming of Built-in programmable ROM

The MCU can stop its function as an MCU in PROM mode for programming the built-in PROM.

PROM mode is set up by setting the $\overline{\text{TEST}}$, $\overline{\text{M}}_0$, and $\overline{\text{M}}_1$ terminals to “Low” level and the RESET terminal to “High” level.

Writing and reading specifications of the PROM are the same as those for the commercial EPROM27256. Using a socket adapter for specific use of each product, programming is possible with a general-purpose PROM writer.

Since an instruction of the HMCS400 series is 10 bits long, a conversion circuit is incorporated to adapt the general-purpose PROM writer. This circuit splits each instruction into five lower bits and five higher bits to write from or read to two addresses. This enables use of a general-purpose PROM. For instance, to write to a 16kword of built-in PROM with a general-purpose PROM writer, specify 32kbyte address (\$0000-\$7FFF). An example of PROM memory map is shown in figure 95.

Notes:

1. When programming with a PROM writer, set up each ROM size to the address given in table b. If it is programmed erroneously to an address given in table 27 or later, check of writing of PROM may become impossible. Particularly, caution should be exercised in the case of a plastic package since reprogramming is impossible with it. Set the data in unused addresses to \$FF.
2. If the indexes of the PROM writer socket, socket adapter and product are not aligned precisely, the product may break down due to overcurrent. Be sure to check that they are properly set to the writer before starting the writing process.
3. Two levels of program voltages (V_{PP}) are available for the PROM: 12.5V and 21V. Our product employs a V_{PP} of 12.5V. If a voltage of 21V is applied, permanent breakdown of the product will result. The V_{PP} of 12.5V is obtained for the PROM writer by setting it according to the Intel 27258 specifications.

Writing/verification

Programming of the built-in program ROM employs a high speed programming method. With this method, high speed writing is effected without voltage stress to the device or without damaging the reliability of the written data.

A basic programming flow chart is shown in figure 96 and a timing chart in figure 97.

For precautions for PROM writing procedure, refer to Section 2, "Characteristics of ZTAT™ Microcomputer's Built-in Programmable ROM and precautions for its Applications."

Table 25 Selection of Mode

Mode	\overline{CE}	\overline{OE}	V _{PP}	O ₀ – O ₇
Writing	"Low"	"High"	V _{PP}	Data input
Verification	"High"	"Low"	V _{PP}	Data output
Prohibition of programming	"High"	"High"	V _{PP}	High impedance

Table 26 PROM Writer Program Address

ROM size	Address
8k	\$0000 – \$3FFF
12k	\$0000 – \$5FFF
16k	\$0000 – \$7FFF

HD404829R Series

Programmable ROM (HD4074829)

The HD4074829 is a ZTAT™ microcomputer with built-in PROM that can be programmed in PROM mode.

PROM Mode Pin Description

- Notes:
1. I/O: Input/output pin, I: Input pin, O: Output pin
 2. Each of O₀–O₄ has two pins; before using, each pair must be connected together.
 3. NUMG and NUMO are not pins for user applications. Connect NUMG to the same potential as GND. Leave NUMO open.

PROM Mode Pin Functions

V_{PP}: Applies the programming voltage (12.5 V ± 0.3 V) to the built-in PROM.

\overline{CE} : Inputs a control signal to enable PROM programming and verification.

\overline{OE} : Inputs a data output control signal for verification.

A₀–A₁₄: Act as address input pins of the built-in PROM.

O₀–O₇: Act as data bus input pins of the built-in PROM. Each of O₀–O₄ has two pins; before using these pins, connect each pair together.

\overline{M}_0 , \overline{M}_1 , RESET, \overline{TEST} : Used to set PROM mode. The MCU is set to the PROM mode by pulling \overline{M}_0 , \overline{M}_1 , and \overline{TEST} low, and RESET high.

Other Pins (FP-100B/FP-100A): Connect pins 1/3 (AV_{CC}), 8/10 (OSC₁), 16/18 (D₂), 17/19 (D₃), 53/55 (R₆₃/SEG16), and 97/99 (V_{CC}) to V_{CC}, and pins 6/8 (AV_{SS}) and 11/13 (X1) to GND. Leave other pins open.

Notes on PROM Programming

Principles of Programming/Erase: A memory cell in a ZTAT™ microcomputer is the same as an EPROM cell; it is programmed by applying a high voltage between its control gate and drain to inject hot electrons into its floating gate. These electrons are stable, surrounded by an energy barrier formed by an SiO₂ film. The change in threshold voltage of a memory cell with a charged floating gate makes the corresponding bit appear as 0; a cell whose floating gate is not charged appears as a 1 bit (figure 98).

The charge in a memory cell may decrease with time. This decrease is usually due to one of the following causes:

- Ultraviolet light excites electrons, allowing them to escape. This effect is the basis of the erasure principle.
- Heat excites trapped electrons, allowing them to escape.
- High voltages between the control gate and drain may erase electrons.

If the oxide film covering a floating gate is defective, the electron erasure rate will be greater. However, electron erasure does not often occur because defective devices are detected and removed at the testing stage.

Figure 98 Cross-Sections of a PROM Cell

PROM Programming: PROM memory cells must be programmed under specific voltage and timing conditions. The higher the programming voltage V_{PP} and the longer the programming pulse t_{PW} is applied, the more electrons are injected into the floating gates. However, if V_{PP} exceeds specifications, the pn junctions may be permanently damaged. Pay particular attention to overshooting in the PROM programmer. In addition, note that negative voltage noise will produce a parasitic transistor effect that may reduce breakdown voltages.

The ZTAT™ microcomputer is electrically connected to the PROM programmer by a socket adapter. Therefore, note the following points:

- Check that the socket adapter is firmly mounted on the PROM programmer.
- Do not touch the socket adapter or the LSI during the programming. Touching them may affect the quality of the contacts, which will cause programming errors.

PROM Reliability after Programming: In general, semiconductor devices retain their reliability, provided that some initial defects can be excluded. These initial defects can be detected and rejected by screening. Baking devices under high-temperature conditions is one method of screening that can rapidly eliminate data-hold defects in memory cells. (Refer to the previous Principles of Programming/Erase section.)

ZTAT™ microcomputer devices are extremely reliable because they have been subjected to such a screening method during the wafer fabrication process, but Hitachi recommends that each device be exposed to 150°C at one atmosphere for at least 48 hours after it is programmed, to ensure its best performance. The recommended screening procedure is shown in figure 99.

Note: If programming errors occur continuously during PROM programming, suspend programming and check for problems in the PROM programmer or socket adapter. If programming verification indicates errors in programming or after high-temperature exposure, please inform Hitachi.

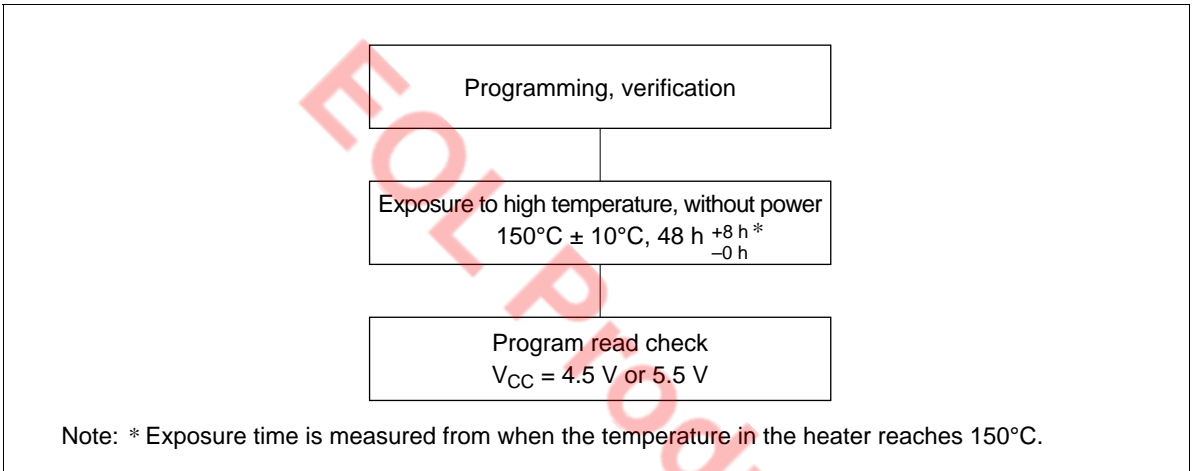

Figure 99 Recommended Screening Procedure

Addressing Modes

RAM Addressing Modes

The MCU has three RAM addressing modes, as shown in figure 100 and described below.

Register Indirect Addressing Mode: The contents of the W, X, and Y registers (10 bits in total) are used as a RAM address.

Direct Addressing Mode: A direct addressing

instruction consists of two words. The first word contains the opcode, and the contents of the second word (10 bits) are used as a RAM address.

Memory Register Addressing Mode: The memory registers (MR), which are located in 16 addresses from \$040 to \$04F, are accessed with the LAMR and XMRA instructions.

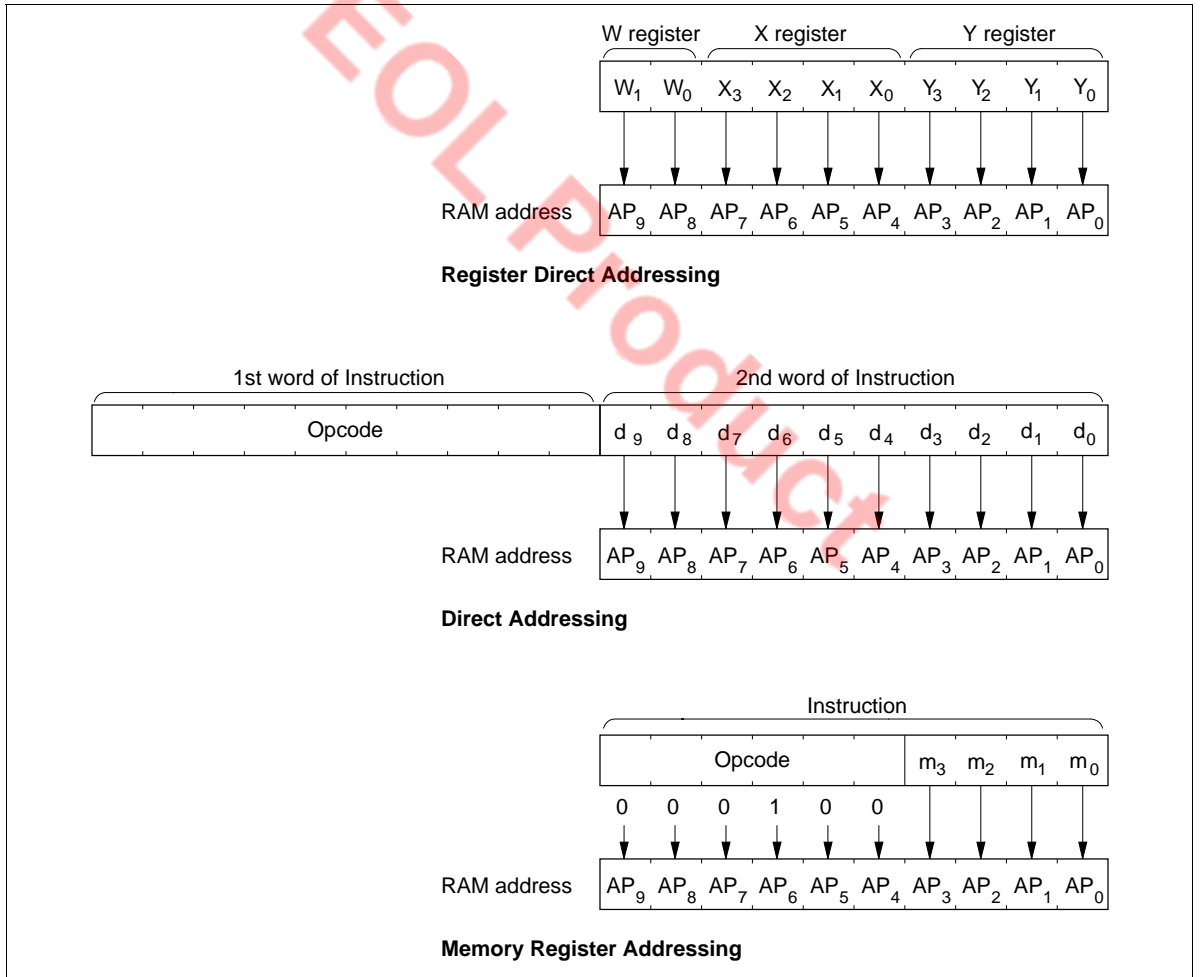

Figure 100 RAM Addressing Modes

ROM Addressing Modes and the P Instruction

The MCU has four ROM addressing modes, as shown in figure 101 and described below.

Direct Addressing Mode: A program can branch to any address in the ROM memory space by executing the JMPL, BRL, or CALL instruction. Each of these instructions replaces the 14 program counter bits (PC_{13} – PC_0) with 14-bit immediate data.

Current Page Addressing Mode: The MCU has 64 pages of ROM with 256 words per page. A program can branch to any address in the current page by executing the BR instruction. This instruction replaces the eight low-order bits of the program counter (PC_7 – PC_0) with eight-bit immediate data. If the BR instruction is on a page boundary (address $256n + 255$), executing that instruction transfers the PC contents to the next physical page, as shown in figure 98. This means that the execution of the BR instruction on a page boundary will make the program branch to the next page.

Note that the HMCS400-series cross macroassembler has an automatic paging feature for ROM pages.

Zero-Page Addressing Mode: A program can branch to the zero-page subroutine area located at \$0000–\$003F by executing the CAL instruction. When the CAL instruction is executed, 6 bits of immediate data are placed in the six low-order bits of the program counter (PC_5 – PC_0), and 0s are placed in the eight high-order bits (PC_{13} – PC_6).

Table Data Addressing Mode: A program can branch to an address determined by the contents of four-bit immediate data, the accumulator, and the B register by executing the TBR instruction.

P Instruction: ROM data addressed in table data addressing mode can be referenced with the P instruction as shown in figure 102. If bit 8 of the ROM data is 1, eight bits of ROM data are written to the accumulator and the B register. If bit 9 is 1, eight bits of ROM data are written to the R1 and R2 port output registers. If both bits 8 and 9 are 1, ROM data is written to the accumulator and the B register, and also to the R1 and R2 port output registers at the same time.

The P instruction has no effect on the program counter.

Figure 101 ROM Addressing Modes

Figure 102 P Instruction

Figure 103 Branching when the Branch Destination is on a Page Boundary

Instruction Set

The MCU has 101 instructions, classified into the following 10 groups:

- Immediate instructions
- Register-to-register instructions
- RAM addressing instructions
- RAM register instructions
- Arithmetic instructions
- Compare instructions
- RAM bit manipulation instructions
- ROM addressing instructions
- Input/output instructions
- Control instructions

The functions of these instructions are listed in tables 27 to 36, and an opcode map is shown in table 37.

Table 27 Immediate Instructions

Operation	Mnemonic	Operation Code	Function	Status	Words/ Cycles
Load A from immediate	LAI i	1 0 0 0 1 1 i_3 i_2 i_1 i_0	$i \rightarrow A$		1/1
Load B from immediate	LBI i	1 0 0 0 0 0 i_3 i_2 i_1 i_0	$i \rightarrow B$		1/1
Load memory from immediate	LMID i,d	0 1 1 0 1 0 i_3 i_2 i_1 i_0 d_9 d_8 d_7 d_6 d_5 d_4 d_3 d_2 d_1 d_0	$i \rightarrow M$		2/2
Load memory from immediate, increment Y	LMIIY i	1 0 1 0 0 1 i_3 i_2 i_1 i_0	$i \rightarrow M$, $Y + 1 \rightarrow Y$	NZ	1/1

Table 28 Register-Register Instructions

Operation	Mnemonic	Operation Code	Function	Status	Words/ Cycles
Load A from B	LAB	0 0 0 1 0 0 1 0 0 0	B → A		1/1
Load B from A	LBA	0 0 1 1 0 0 1 0 0 0	A → B		1/1
Load A from W	LAW*	0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	W → A		2/2*
Load A from Y	LAY	0 0 1 0 1 0 1 1 1 1	Y → A		1/1
Load A from SPX	LASPX	0 0 0 1 1 0 1 0 0 0	SPX → A		1/1
Load A from SPY	LASPY	0 0 0 1 0 1 1 0 0 0	SPY → A		1/1
Load A from MR	LAMR m	1 0 0 1 1 1 m ₃ m ₂ m ₁ m ₀	MR (m) → A		1/1
Exchange MR and A	XMRA m	1 0 1 1 1 1 m ₃ m ₂ m ₁ m ₀	MR (m) ↔ A		1/1

Note: * Although the LAW and LWA instructions require an operand (\$000) in the second word, the assembler generates it automatically and thus there is no need to specify it explicitly.

Absolute Maximum Ratings

Item	Symbol	Value	Unit	Notes
Supply voltage	V_{CC}	-0.3 to +7.0	V	
Programming voltage	V_{PP}	-0.3 to +14.0	V	1
Pin voltage	V_T	-0.3 to $V_{CC} + 0.3$	V	
Total permissible input current	ΣI_o	100	mA	2
Total permissible output current	$-\Sigma I_o$	50	mA	3
Maximum input current	I_o	4	mA	4, 5
		30	mA	4, 6
Maximum output current	$-I_o$	4	mA	7, 8
Operating temperature	T_{opr}	-20 to +75	°C	
Storage temperature	T_{stg}	-55 to +125	°C	

Notes: Permanent damage may occur if these absolute maximum ratings are exceeded. Normal operation must be under the conditions stated in the electrical characteristics tables. If these conditions are exceeded, the LSI may malfunction or its reliability may be affected.

1. Applies to D_{11} (V_{PP}) of the HD4074829.
2. The total permissible input current is the total of input currents simultaneously flowing in from all the I/O pins to ground.
3. The total permissible output current is the total of output currents simultaneously flowing out from V_{CC} to all I/O pins.
4. The maximum input current is the maximum current flowing from each I/O pin to ground.
5. Applies to R0–R7.
6. Applies to D_0 – D_9 .
7. The maximum output current is the maximum current flowing out from V_{CC} to each I/O pin.
8. Applies to D_0 – D_9 and R0–R7.

HD404829R Series

Electrical Characteristics

DC Characteristics (HD404828R, HD4048212R, HD404829R: $V_{CC} = 2.7$ to 6.0 V, $GND = 0$ V, $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$; HD4074829: $V_{CC} = 2.7$ to 5.5 V, $GND = 0$ V, $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$, unless otherwise specified)

Item	Symbol	Pin(s)	Min	Typ	Max	Unit	Test Condition	Notes
Input high voltage	V_{IH}	RESET, \overline{SCK} , SI, $\overline{INT_0}$, $\overline{INT_1}$, $\overline{INT_2}$, $\overline{INT_3}$, $\overline{INT_4}$, \overline{STOPC} , \overline{EVNB} , EVND	$0.9V_{CC}$	—	$V_{CC} + 0.3$	V	—	
		OSC ₁	$V_{CC} - 0.3$	—	$V_{CC} + 0.3$	V	External clock operation

	I_{SBY2}	V_{CC}	—	0.2	0.7	mA	$V_{CC} = 3.0$ V, $f_{osc} = 800$ kHz, LCD on	3

Notes on next page.

Item	Symbol	Pin(s)	Min	Typ	Max	Unit	Test Condition	Notes
Current dissipation in subactive mode	I_{SUB}	V_{CC} (HD404828R, HD4048212R, HD404829R)	—	25	70	μA	$V_{CC} = 3.0 V$, LCD on 32-kHz oscillator	4
		V_{CC} (HD4074829)	—	70	150	μA	$V_{CC} = 3.0 V$, LCD on 32-kHz oscillator	4
Current dissipation in watch mode	I_{WTC1}	V_{CC} (HD404828R, HD4048212R, HD404829R)	—	15	40	μA	$V_{CC} = 3.0 V$, LCD on 32-kHz oscillator	4
		V_{CC} (HD4074829)	—	18	40			
	I_{WTC2}	V_{CC} (HD404828R, HD4048212R, HD404829R)	—	5	10	μA	$V_{CC} = 3.0 V$, LCD off 32-kHz oscillator	4
		V_{CC} (HD4074829)	—	8	15			
Current dissipation in stop mode	I_{STOP}	V_{CC} (HD404828R, HD4048212R, HD404829R)	—	0.5	5	μA	$V_{CC} = 3.0 V$, No 32-kHz oscillator	4
		V_{CC} (HD4074829)	—	1	10			
Stop mode retaining voltage	V_{STOP}	V_{CC}	2	—	—	V	No 32-kHz oscillator	5

Notes: 1. Output buffer current is excluded.

2. I_{CC1} and I_{CC2} are the source currents when no I/O current is flowing while the MCU is in reset state.

Test conditions: MCU: Reset
Pins: RESET at V_{CC} ($V_{CC} - 0.3 V$ to V_{CC})
TEST at V_{CC} ($V_{CC} - 0.3 V$ to V_{CC})

3. I_{SBY1} and I_{SBY2} are the source currents when no I/O current is flowing while the MCU timer is operating.

Test conditions: MCU: I/O reset
Serial interface stopped
Standby mode
Pins: RESET at GND (0 V to 0.3 V)
TEST at V_{CC} ($V_{CC} - 0.3 V$ to V_{CC})

4. These are the source currents when no I/O current is flowing.

Test conditions: Pins: RESET at GND (0 V to 0.3 V)
TEST at V_{CC} ($V_{CC} - 0.3 V$ to V_{CC})
D₁₁ (V_{PP}) at V_{CC} ($V_{CC} - 0.3 V$ to V_{CC}) for the HD4074829

5. The required voltage for RAM data retention.

HD404829R Series

I/O Characteristics for Standard Pins (HD404828R, HD4048212R, HD404829R: $V_{CC} = 2.7$ to 6.0 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$; HD4074829: $V_{CC} = 2.7$ to 5.5 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$, unless otherwise specified)

Item	Symbol	Pin(s)	Min	Typ	Max	Unit	Test Condition	Notes

Notes on next page.

- Notes:
1. With a crystal oscillator, $V_{cc}=3.0V$ to $6.0V$.
 2. There are three oscillator stabilization times.
 - (1) At power on, the time between the point where V_{cc} reaches $2.7V$ and the point where oscillation has stabilized.
 - (2) At clearing stop mode, the time between the point where the RESET pin reaches the high level and the point where oscillation has stabilized.
 - (3) At clearing stop mode, the time between the point where the \overline{STOPC} pin reaches the low level and the point where oscillation has stabilized.

At power on or when stop mode is cleared, RESET or \overline{STOPC} must be input for at least t_{RC} to ensure the oscillator stabilization time.

Since the oscillator stabilization time will depend on circuit constants and stray capacitances, determine the oscillator by consulting with the oscillator's manufacturer.

Be sure to set miscellaneous register (MIS) bits MIS1 and MIS0 to match the system clock oscillator stabilization time.
 3. Refer to figure 99.
 4. Refer to figure 100. The t_{cyc} unit applies when the MCU is in standby or active mode.
The t_{subcyc} unit applies when the MCU is in watch or subactive mode.
 5. Refer to figure 101.
 6. Refer to figure 102.

Notes on ROM Out

Please pay attention to the following items regarding ROM out.

On ROM out, fill the ROM area indicated below with 1s to create the same data size as a 16-kword version (HD404829R). A 16-kword data size is required to change ROM data to mask manufacturing data since the program used is for a 16-kword version.

This limitation applies when using an EPROM or a data base.

HD404829R Series

HD404829R/HD404828R/HD4048212R Option List

Please check off the appropriate applications and enter the necessary information.

Date of order	/	/
Customer		
Department		
Name		
ROM code name		
LSI number (Hitachi entry)		

1. ROM Size

<input type="checkbox"/>	HD404828R	8-kword
<input type="checkbox"/>	HD4048212R	12-kword
<input type="checkbox"/>	HD404829R	16-kword

2. Optional Function

- * With 32-kHz CPU operation, with time-base for clock
- * Without 32-kHz CPU operation, with time-base for clock
- Without 32-kHz CPU operation, without time-base for clock

Note: * Options marked with an asterisk require a subsystem crystal oscillator (X1, X2).

3. ROM Code Data Type

Please specify the first type below (the upper bits and lower bits are mixed together), when using the EPROM on-package microcomputer type (including ZTAT™ version).

- The upper bits and lower bits are mixed together. The upper five bits and lower five bits are programmed to the same EPROM in alternating order (i.e., LULULU...).
- The upper bits and lower bits are separated. The upper five bits and lower five bits are programmed to different EPROMs.

4. System Oscillator (OSC1 and OSC2)

<input type="checkbox"/>	Ceramic oscillator	f =	MHz
<input type="checkbox"/>	Crystal oscillator	f =	MHz
<input type="checkbox"/>	External clock	f =	MHz

5. Stop Mode

- Used
- Not used

6. Package

- FP-100A
- FP-100B
- TFP-100B

Cautions

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
