MAX1645B Evaluation Kit/Evaluation System

General Description

EV System

DESCRIPTION

The MAX1645B evaluation kit (EV kit) is an efficient, multichemistry battery charger. It uses the Intel System Management Bus (SMBus[™]) to control the battery regulation voltage, charger current output, and input current-limit set point.

The MAX1645B EV kit can charge one, two, three, or four series Li+ cells with a current up to 3A.

The MAX1645B evaluation system (EV system) consists of a MAX1645B EV kit and the Maxim SMBUSMON board. The MAX1645B EV kit includes Windows® 95-/98/ 2000-/XP-compatible software to provide a user-friendly interface.

_Features

 Charges Any Battery Chemistry: Li+, NiCd, NiMH, Lead Acid, etc.

MXXM

- SMBus-Compatible 2-Wire Serial Interface
- ♦ 3A (max) Battery Charge Current
- Up to 18.4V Battery Voltage
- Up to +28V Input Voltage
- Easy-to-Use Software Included
- Proven PC Board Layout
- + Fully Assembled and Tested Surface-Mount Board

Note: Please indicate that you are using the MAX1645B when contacting the above component suppliers.

Quick Start

Recommended Equipment

Component Suppliers

- DC source to supply the input current to the charger. This source must be capable of supplying a voltage greater than the battery-voltage set point and have sufficient current rating.
- Voltmeter
- Smart battery
- Computer running Windows 95, 98, 2000, or XP
- 9-pin serial extension cable
- SMBUSMON board

Procedure

The MAX1645B EV kit is a fully assembled and tested board. Follow the steps below to verify board operation. **Do not turn on the power supply until all connections are completed. Observe all precautions on the battery manufacturer's data sheet.**

1) Set the VPP jumper on the SMBUSMON board to VCC5.

Table 1. Jumper Functions

JUMPER	STATE	FUNCTION
	Closed*	SCL pulled up to V_{DD} through a 10k Ω resistor.
JU1	Open	SCL not pulled up to V _{DD} ; SCL must be pulled up to external supply.
	Closed*	SDA pulled up to V _{DD} through a 10k Ω resistor.
JU2	Open	SDA not pulled up to V _{DD} ; SDA must be pulled up to external supply.
11.13	Closed*	$10k\Omega$ resistor connected between thermistor and ground nodes, simulating the attach- ment of a smart battery.
000	Open	$10k\Omega$ resistor disconnected; for use when an actual smart battery will be connected to the EV kit.

*Indicates default jumper setting

- 2) Carefully connect the boards by aligning the 20-pin connector of the MAX1645B EV kit with the 20-pin header of the SMBUSMON board. Gently press them together.
- Connect a cable from the computer's serial port to the SMBUSMON interface board. Use a straight-through 9-pin female-to-male cable.
- 4) Install the software by running the INSTALL.EXE program. The install program copies the files and creates icons for them in the Windows 95/98/2000/XP start menu. An uninstall program is included with the software. Click on the UNINSTALL icon to remove the EV kit software from the hard drive.
- 5) Connect power to the SMBUSMON board.
- 6) Connect the input-current supply across the ADAPTER_IN and PGND pads.
- 7) Connect a smart battery to connector H2.
- 8) Turn on the power supply.
- 9) Start the MAX1645B EV kit software.
- 10) Verify current is being delivered to the battery.

Figure 1. Block Diagram of MAX1645B EV System

_Detailed Description of Software

The MAX1645B program provides easy access to the MAX1645B registers. It is also capable of reading the registers of a smart battery and monitoring SMBus traffic.

Upon execution of the program, the software enables the MAX1645B smart-charger command panel (Figure 2), after which any of the allowed SMBus commands can be sent to the MAX1645B. Refer to the MAX1645B data sheet for more information regarding the allowed SMBus commands.

Smart-Charger Command Panel

ChargeVoltage()

To issue the ChargeVoltage() command to the MAX1645B, enter the desired voltage, in millivolts, into the Charging Voltage edit field and select the adjacent **Write** button.

ChargeCurrent()

To issue the ChargeCurrent() command to the MAX1645B, enter the desired current, in milliamps, into the Charging Current edit field and select the adjacent **Write** button.

Figure 3. MAX1645B Smart-Charger Command Panel Showing the Pulldown List For Charger Spec Info and Alarm Warning

Auto Rewrite Checkboxes

The MAX1645B needs to receive a ChargeVoltage() or ChargeCurrent() command every 175s (typ); otherwise, the MAX1645B times out and terminates charging. Usually, a smart battery sends these necessary commands. However, when not using a smart battery with the MAX1645B EV kit, select either (or both) of the Auto Rewrite checkboxes located directly under the Charging Current and Charging Voltage edit fields. This generates a ChargeVoltage() or ChargeCurrent() command at the selected time interval located on the Timer panel.

ChargerMode()

To issue the ChargerMode() command to the MAX1645B, select a combination of checkboxes in the Charger Mode panel of commands. Each checkbox represents a bit in the ChargerMode() command word. Select the checkboxes next to the bits for which the software should write a 1, unselect the checkboxes for a 0. Send the command by selecting the **Write** button.

Evaluate: MAX1645B

ChargerStatus()

Charger status is shown in the Charger Status panel. Each of the bits in the ChargerStatus() command word are shown individually with a short description of the bit.

By default, the status is automatically read once every two seconds. Disable this feature by unselecting the Active Read: Charger checkbox located on the Timer panel. Change the refresh time by entering a new value into the Timer Interval edit box and select the **Set Interval** button. When Auto Refresh is disabled, issue a ChargerStatus() command by selecting the **Read** button on the Charger Status panel.

ChargerSpecInfo()

ChargerSpecInfo() returns the Charger Specification (0x0009) from the MAX1645B. This command is available through the "Other Bitmapped Charger Registers..." panel. Select Charger Spec Info by picking it from the pulldown list located directly under the Other Bitmapped Charger Registers... label. Issue a ChargerSpecInfo() command by selecting the **Read** button. The returned hexadecimal value is shown at the bottom of the panel.

AlarmWarning()

Alarm Warning is shown on the Other Bitmapped Charger Registers... panel (Figure 3). Select Alarm Warning by picking it from the pulldown list located directly under the Other Bitmapped Charger Registers... label. Each of the bits in the AlarmWarning() command word are shown individually with a short description of the bit and a checkbox. Select the checkboxes next to the bits for which the software should write a 1; unselect the checkboxes for a 0. Send the command to the MAX1645B by selecting the **Write** button.

Smart-Battery Command Panel

The software is capable of reading the registers of a smart battery. The smart battery page of the software is shown in Figure 4. The software only reads the registers selected with checkmarks. By default, the registers are automatically read once every two seconds. Disable this feature by unselecting the Active Read: Battery checkbox located on the Timer panel. Change the refresh time by entering a new value into the Timer Interval edit box and select the **Set Interval** button. When Auto Refresh is disabled, read the battery by selecting the **Refresh** button.

Detailed Description _____of Hardware

Input Current Limiting

The MAX1645B EV kit is configured to regulate the battery current so that the total V_{IN} input current does not exceed 2.5A. If a load is connected across the LOAD

and GND pads (another system power supply, for example) that would cause the total current from V_{IN} to exceed 2.5A, the MAX1645B will automatically decrease its charging current to regulate the input current to 2.5A. Refer to the MAX1645B data sheet for more information regarding input current limiting.

Connecting a Smart Battery

The MAX1645B EV kit includes a five-element terminal block to facilitate connecting the EV kit to a smart battery. Refer to the smart battery specification to identify the type of smart battery connector suited to your application. Make sure that the EV kit power is turned off, and connect the (+), C, D, T, and (-) terminals from the EV kit board to the smart battery connector using no more than 2 inches of wire. Remove the JU3 shunt, attach a smart battery to the smart battery connector, and turn the EV kit power back on. See Figure 1 if necessary.

Connecting an Electronic Load

If a smart battery is unavailable, an electronic load can be connected across the BATT and GND pads on the MAX1645B EV kit board. Make sure that the EV kit power is turned off before connecting a load. Make sure that JU3 is shunted, making it appear to the MAX1645B as if a smart battery were connected. After the load is connected, program the load in voltage mode and set the electronic load to clamp at 5V. Turn on the power to the EV kit, and program the MAX1645B with a charging voltage of 12V at the maximum charging current. Verify that the MAX1645B is supplying the maximum current to the load. Increase the electronic load clamp voltage in 1V increments, and verify that as the electronic load voltage crosses 12V, the MAX1645B transitions from current regulation to voltage regulation; as the electronic load voltage increases beyond 12V, the BATT voltage should remain fixed at 12V.

Layout Considerations

The MAX1645B EV kit layout is optimized for fast switching and high currents. The traces connecting the power components must be able to carry at least 3A. Take care to ensure that C1 and C2 (the input capacitors), D2 and N2 (the synchronous rectifier), and C3 and C4 (the output capacitors) are all connected to GND at a common point, and to isolate the power GND from the quiet analog GND.
