Initial 0: TEST, WADA, USEL, TE, FSEL[1:0], TSEL[0], UF, TF, AF, CSEL[1], UIE, TIE, RESET, VDETOFF, SWOFF, BKSMP[1:0], VBATSW.

Initial 1: VLF, VDET, CSEL[0].

- All other register values are undefined, so make sure to reset the module before using it.
- The bits marked with "O" can be read out only after initializing.
- The bits marked with "●" are RAM bits which can be used to write or read any data.
- Only 0 can be written to UF, TF, AF, VLF, VDET bits.

**I<sup>2</sup>C Bus Interface**

I<sup>2</sup>C bus supports bi-directional communications through a serial clock line SCL and a serial data line SDA. I<sup>2</sup>C bus device can be defined as "Master" and "Slave".  
SRC32C can only be used as Slave.

I<sup>2</sup>C bus includes START, RESTART, STOP conditions, the duration between START and STOP must be less than 1 second just in case the bus to be set to standby mode automatically.  
A new START condition must be transferred before restarting of any communications.

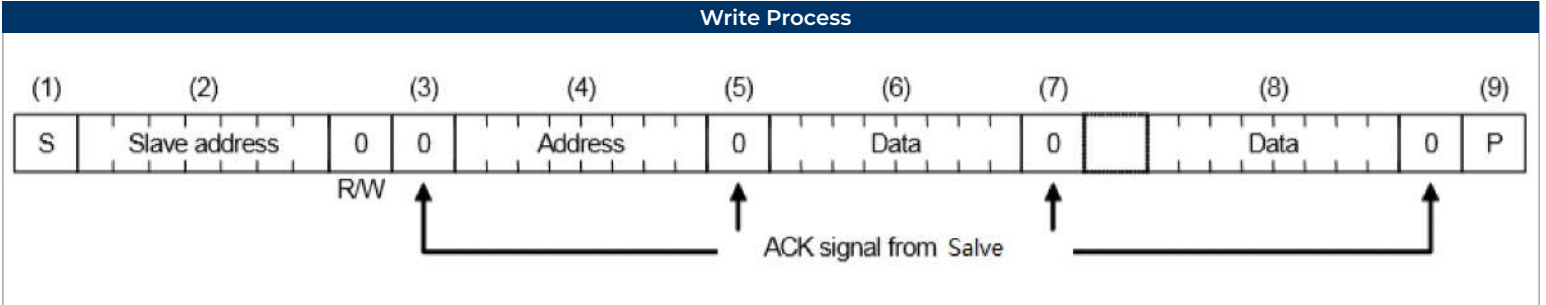

SRC32C I<sup>2</sup>C bus interface supports single byte read/write operations as well as multiple bytes incremental access.  
After 0x7F address, the next one will be 0x00.

Slave Address									
Transfer Data	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	R/W
65h (Read)	0	1	1	0	0	1	0	1	Read
64h (Write)	0	1	1	0	0	1	0	0	Write

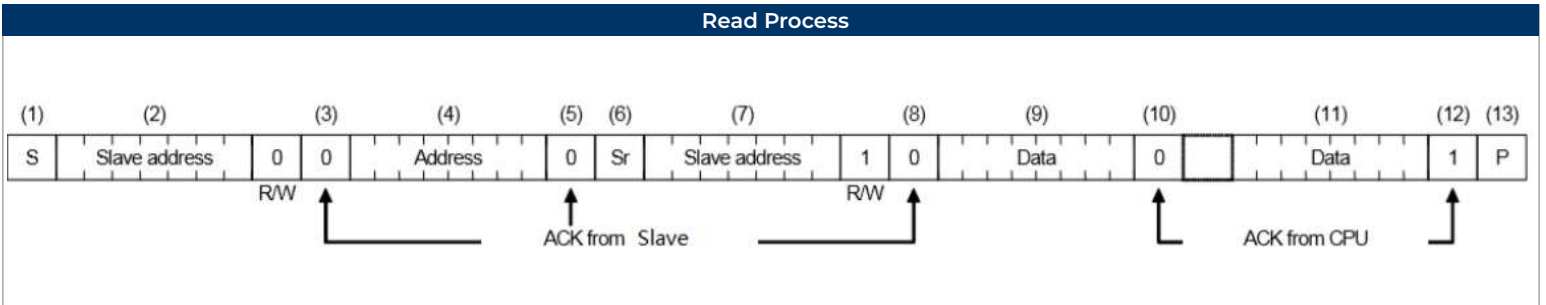

SRC32C I<sup>2</sup>C bus Slave Address is [0110 010\*].

It is assumed CPU is master and SRC32C is slave in this section.

I<sup>2</sup>C bus includes an address auto-increment function, once the initial address has been specified, the SRC32C increments (+1) the address automatically after each data is sent, then to write next data.

- (1) CPU sends start condition[S]
- (2) CPU sends SRC32C's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from SRC32C
- (4) CPU sends write address to SRC32C
- (5) CPU verifies ACK signal from SRC32C
- (6) CPU sends write data to the address specified at step (4)
- (7) CPU verifies ACK signal from SRC32C
- (8) Repeat (6) (7) if multiple bytes need to be written, address will be incremented automatically
- (9) CPU ends stop condition[P]

Writing the address to be read with write mode firstly, then reading the data with read mode.

- (1) CPU sends start condition[S]
- (2) CPU sends SRC32C's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from SRC32C
- (4) CPU sends address for reading from SRC32C
