AS1710/AS1712

High-Output-Drive, 10MHz, 10V/µs, Rail-to-Rail I/O Op Amps with Shutdown

1 General Description

The AS1710/AS1712 are low-offset, high-output CMOS op-amps that deliver 200mA of peak output current from a single supply (2.7V to 5.5V).

These devices were specifically designed to drive typical headset levels (32Ω), as well as bias RF power amplifiers for wireless handset applications.

The devices are available as the standard products shown in Table 1. See also Ordering Information on page 18.

Table 1. Standard Products

Model	Description	Package
AS1710A	Single Op Amp with Shutdown	SC70-6
AS1710B	Single Op Amp	SC70-5
AS1712A	Quad Op Amp with Shutdown	TQFN-16 (3x3mm)

These rail-to-rail I/O, wide-bandwidth amplifiers exhibit a high slew rate of 10V/µs and a gain-bandwidth product of 10MHz.

The integrated shutdown feature (not included in B versions) drives the output low.

These devices operate over the entire industrial temperature range (-40ºC to +85ºC).

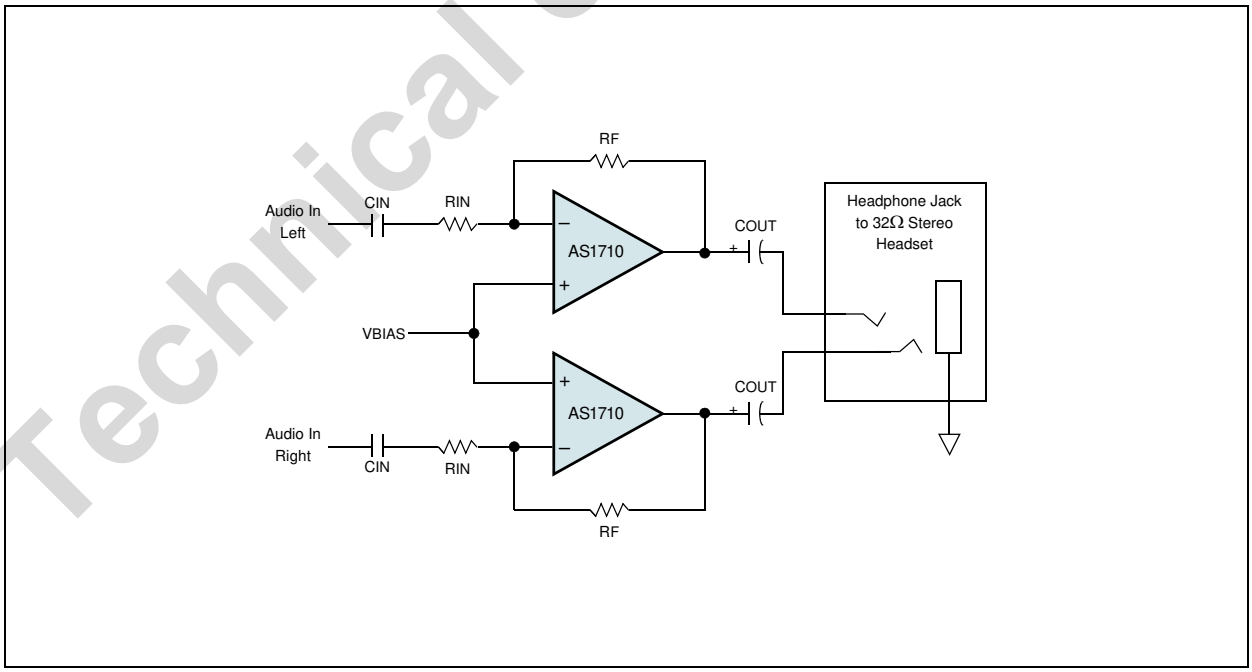
2 Key Features

- Constant Output Drive Capability: 50mA
- Rail-to-Rail Input and Output
- Supply Current: 1.6mA
- Single-Supply Operation: 2.7V to 5.5V
- Gain-Bandwidth Product: 10MHz
- High Slew Rate: 10V/µs
- Voltage Gain: 100dB (RLOAD = 100kΩ)
- Power-Supply Rejection Ratio: -85dB
- No Phase Reversal for Overdriven Inputs
- Unity-Gain Stable for Capacitive Loads: Up to 100pF
- Shutdown Mode (AS1710A) Current: 1nA typ
- Package Types:
  - SC70-6
  - SC70-5
  - TQFN-16 (3x3mm)

3 Applications

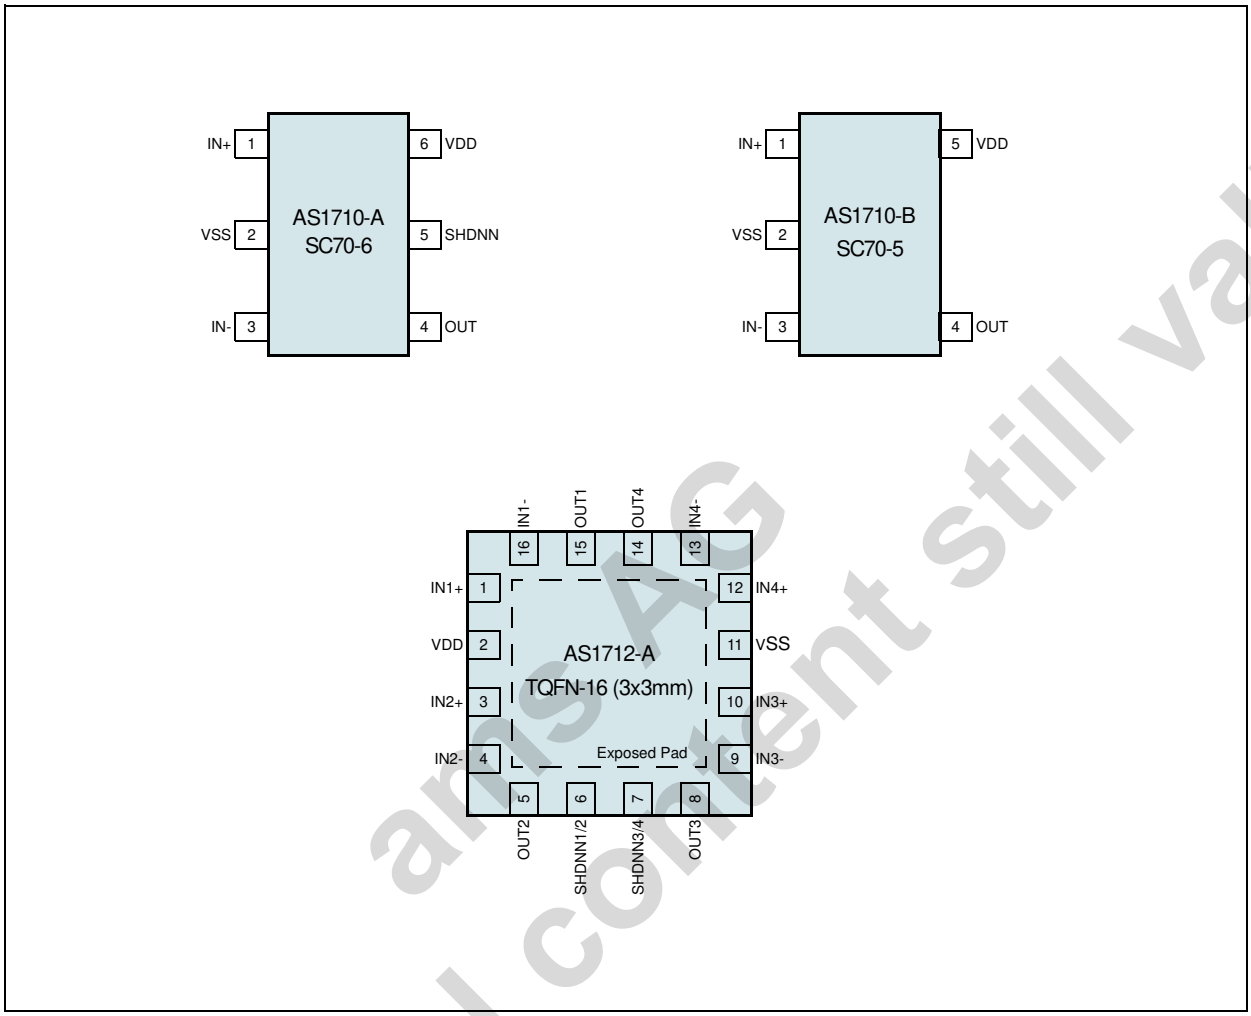
The devices are ideal for portable/battery-powered audio applications, portable headphone speaker drivers (32Ω), hands-free mobile phone kits, TFT panels, sound ports/cards, set-top boxes, biasing controls, DAC converter buffers, transformer/line drivers, motor drivers, and any other battery-operated audio device.

Figure 1. AS1710 - Typical Application



4 Pin Assignments

Figure 2. Pin Assignments (Top View)



4.1 Pin Descriptions

Table 2. Pin Descriptions

Pin Number	Pin Name	Description
See Figure 2	IN+	Non-inverting Input
	IN-	Inverting Input
	VDD	Positive Supply Input
	VSS	Negative Supply Input. This pin must be connected to ground in single-supply applications.
	SHDNN	Active Low Shutdown Control
	OUT	Amplifier Output
	Exposed Pad	Exposed Pad. This pin also functions as a heat sink. Solder it to a large pad or to the circuit-board ground plane to maximize power dissipation.

5 Absolute Maximum Ratings

Stresses beyond those listed in Table 3 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Electrical Characteristics on page 4 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Absolute Maximum Ratings

Parameter		Min	Max	Units	Comments
Electrical Parameters					
Supply Voltage (VDD to VSS)			+7	V	
Supply Voltage (All Other Pins)		VSS - 0.3	VDD + 0.3	V	
Output Short-Circuit Duration to VDD or VSS			1	s	
Thermal Information					
Continuous Power Dissipation	SC70-5		247	mW	Derate at 31mW/ºC above 70ºC
	SC70-6		245		
Thermal Resistance ΘJA	TQFN-16 (3x3mm)		33	ºC/W	on PCB
Temperature Ranges and Storage Conditions					
Storage Temperature Range		-65	+150	ºC	
Junction Temperature			+150	ºC	
Package Body Temperature			+260	ºC	The reflow peak soldering temperature (body temperature) specified is in accordance with *IPC/ JEDEC J-STD-020 "Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices".* The lead finish for Pb-free leaded packages is matte tin (100% Sn).
Humidity non-condensing		5	85	%	
Moisture Sensitive Level		1			Represents a maximum floor life time of unlimited

6 Electrical Characteristics

All limits are guaranteed. The parameters with Min and Max values are guaranteed by production tests or SQC (Statistical Quality Control) methods.

6.1 DC Electrical Characteristics

VDD = 2.7V, VSS = 0V, VCM = VDD/2, VOUT = VDD/2, RLOAD = Infinite, VSHDNN = VDD, Typical values at TAMB = 25ºC.

Table 4. DC Electrical Characteristics

Symbol	Parameter	Condition		Min	Typ	Max	Unit
TAMB	Operating Temperature Range			-40		+85	ºC
VDD	Supply Voltage Range	Inferred from Power Supply Rejection Ratio Test		2.7		5.5	V
VOFFSET	Input Offset Voltage			-3	0.6	+3	mV
IBIAS	Input Bias Current	VCM = VSS to VDD			50[1]		pA
IOFFSET	Input Offset Current	VCM = VSS to VDD			50[1]		pA
RIN	Input Resistance				1000[1]		MΩ
VCM	Common Mode Input Voltage Range	Inferred from Common Mode Rejection Ratio[1]		VSS		VDD	V
CMRR	Common Mode Rejection Ratio	VSS < VCM < VDD		-45	-70		dB
PSRR	Power Supply Rejection Ratio	VDD = 2.7 to 5.5V		-70	-85		dB
ROUT	Shutdown Output Impedance	VSHDNN = 0V (A-Versions)			130[1]		Ω
VOUT-SHDNN	Shutdown Output Voltage	VSHDNN = 0V, RLOAD = 2kΩ to VDD (A-Versions)			170	300	mV
AVOL	Large Signal Voltage Gain	VSS + 0.20V < VOUT < VDD - 0.20V	RLOAD = 100kΩ	85	100		dB
			RLOAD = 2kΩ	79	92		
			RLOAD = 200Ω	69	80		
VOUT	Output Voltage Swing	VDD - VOH or VOL - VSS	RLOAD = 32Ω		350	650	mV
			RLOAD = 200Ω		70	120	
			RLOAD = 2kΩ		9	20	
	Output Voltage	VDD - VOH or VOL - VSS	ILOAD = 10mA, VDD = 2.7V		55	100	mV
			ILOAD = 30mA, VDD = 5V		100	180	
IOUT	Output Source/Sink Current	VDD = 2.7V, V- = VCM, V+ = VCM±100mV			100		mA
		VDD = 5.0V, V- = VCM, V+ = VCM±100mV			200		
IDD	Quiescent Supply Current per Op Amp Output	VDD = 2.7V, VCM = VDD/2			1.6	3.2	mA
		VDD = 5.0V, VCM = VDD/2			2.3	4.6	
IDD-SHDNN	Shutdown Supply Current per Op Amp (A-Versions)	VSHDNN = 0V	VDD = 2.7V		1	2000[1]	nA
	SHDNN Logic Threshold (A-Versions)	Shutdown Mode			VSS + 0.3		V
		Normal Operation			VDD - 0.3		
	SHDNN Input Bias Current	VSS < VSHDNN < VDD (A-Versions)			50[1]		pA

1. Guaranteed by design.

6.2 AC Electrical Characteristics

VDD = 2.7V, VSS = 0V, VCM = VDD/2, VOUT = VDD/2, RLOAD = Infinite, VSHDNN = VDD, Typical values at TAMB = 25ºC.

Table 5. AC Electrical Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Units
GBWP	Gain-Bandwidth Product	VCM = VDD/2		10		MHz
FPBW	Full-Power Bandwidth	VOUT = 2VP-P, VDD = 5V		2.5		MHz
SR	Slew Rate			10		V/µs
PM	Phase Margin			70		deg
GM	Gain Margin[1]			15		dB
THD+N	Total Harmonic Distortion Plus Noise	f = 10kHz, VOUT = 2VP-P, AVCL = 1V/V		0.05		%
CIN	Input Capacitance			6		pF
en	Voltage-Noise Density[1]	f = 1kHz		15		nV/√Hz
		f = 10kHz		10		
	Capacitive-Load Stability	AVCL = 1V/V, no sustained oscillations		100		pF
tSHDN	Shutdown Time (AS1710A)			1		µs
tENABLE	Enable Time from Shutdown (AS1710A)			7		µs
tON	Power-Up Time			20		ns

1. Guaranteed by design.

7 Typical Operating Characteristics

VDD = 2.7V; VSS = 0V, VCM = VDD/2, VOUT = VDD/2, RLOAD = ∞, VSHDNN = VDD TAMB = +25ºC (unless otherwise specified).

8 Application Information

8.1 Package Power Dissipation

Caution: Due to the high output current drive, this op-amp can exceed the absolute maximum power-dissipation rating. Normally, when peak current is less than or equal to 40mA the maximum package power dissipation is not exceeded for any of the package types offered.

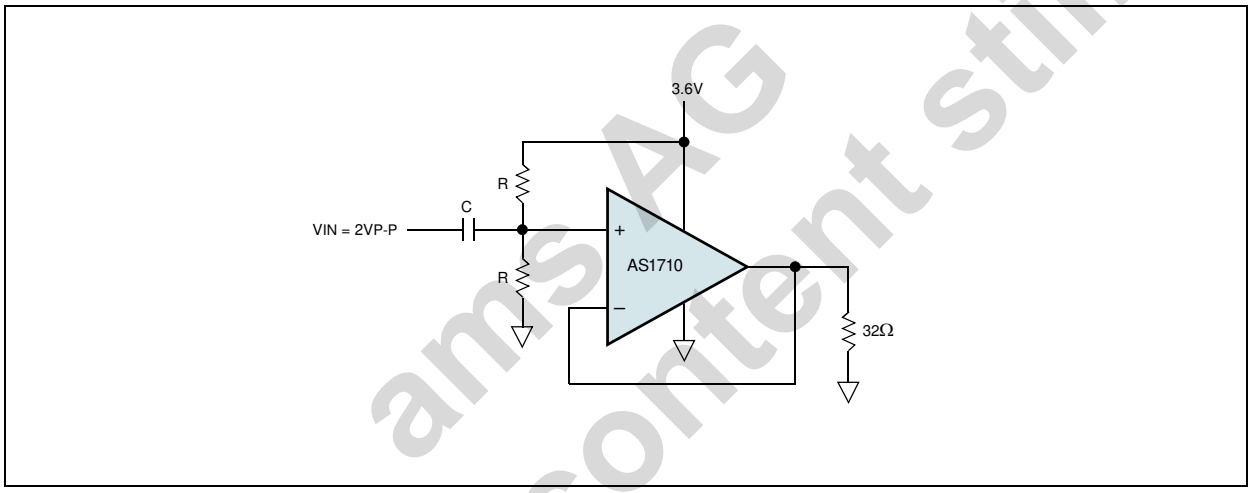
The absolute maximum power-dissipation rating of each package should always be verified. (EQ 1) gives an approximation of the package power dissipation:

$$PPACKAGEDISS \cong VRMS\ IRMS\ COS\theta \quad (EQ\ 1)$$

Where:

VRMS is the RMS voltage from VDD to VOUT when sourcing current, and from VOUT to VSS when sinking current.
IRMS is the RMS current flowing in or out of the op-amp and the load.
θ is the phase difference between the voltage and the current. For resistive loads, COSθ = 1.

Figure 21. Typical AS1710/AS1712 Single-Supply Application



VRMS can be calculated as:

$$VRMS \cong (VDD - VDC) + VPEAK / \sqrt{2} \quad (EQ\ 2)$$

Where:

VDC is the DC component of the output voltage.
VPEAK is the highest positive excursion of the AC component of the output voltage.

For the circuit shown in Figure 21:

$$VRMS = (3.6V - 1.8V) + 1.0V/\sqrt{2} = 2.507VRMS$$

IRMS can be calculated as:

$$IRMS \cong IDC + (IPEAK/\sqrt{2}) \quad (EQ\ 3)$$

Where:

IDC is the DC component of the output current.
IPEAK is the highest positive excursion of the AC component of the output current.

For the circuit shown in Figure 21:

$$IRMS = (1.8V/32\Omega) + (1.0V/32\Omega)/\sqrt{2} = 78.4mARMS$$

Therefore, for the circuit in Figure 21 the package power dissipation can be calculated as:

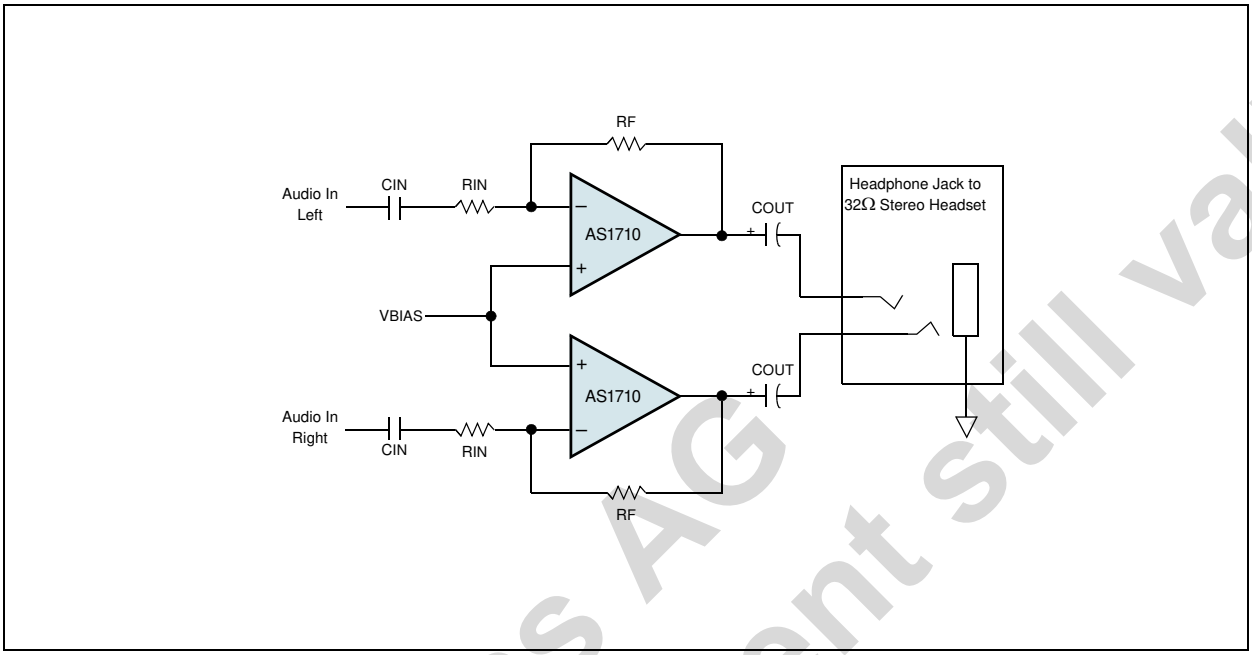
$$PPACKAGEDISS = VRMS\ IRMS\ COS\theta = 196mW$$

Adding a coupling capacitor improves the package power dissipation because there is no DC current to the load, as shown in Figure 22 on page 11.

8.2 60mW Single-Supply Stereo Headphone Driver

Two AS1710 amplifiers can be used as a single-supply, stereo headphone driver. The circuit shown in Figure 22 can deliver 60mW per channel with 1% distortion from a single 5V supply.

Figure 22. Stereo Headphone Driver Application (with Coupling Capacitor)



In Figure 22, CIN and RIN form a high-pass filter that removes the DC bias from the incoming signal. The -3dB point of the high-pass filter is given by:

$$f\text{-}3dB = 1/(2\pi RINCIN) \quad (EQ\ 4)$$

Choose gain-setting resistors RIN and RF according to the amount of desired gain, keeping in mind the maximum output amplitude.

COUT blocks the DC component of the amplifier output, preventing DC current flowing to the load. The output capacitor and the load impedance form a high-pass filter with the -3dB point determined by:

$$f\text{-}3dB = 1/(2\pi RLOADCOUT) \quad (EQ\ 5)$$

For a 32Ω load, a 100µF aluminum electrolytic capacitor gives a low-frequency pole at 50Hz.

8.3 Rail-to-Rail Input Stage

The AS1710/AS1712 CMOS op-amps have parallel connected N- and P-channel differential input stages that combine to accept a common-mode range extending to both supply rails. The N-channel stage is active for common-mode input voltages typically greater than (VSS + 1.2V), and the p-channel stage is active for common-mode input voltages typically less than (VDD - 1.2V).

8.4 Rail-to-Rail Output Stage

The minimum output is within millivolts of ground for single- supply operation, where the load is referenced to ground (VSS). Figure 23 shows the input voltage range and the output voltage swing of an AS1710 connected as a voltage follower. The maximum output voltage swing is load dependent although it is guaranteed to be within 500mV of the positive rail (VDD = 2.7V) even with maximum load (32Ω to ground).

Figure 23. Rail-to-Rail Input/Output Range, 100kΩ

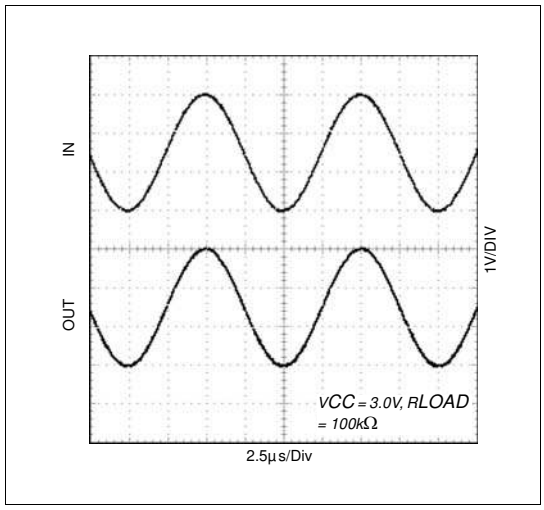


Figure 24. Rail-to-Rail Input/Output Range, 32Ω

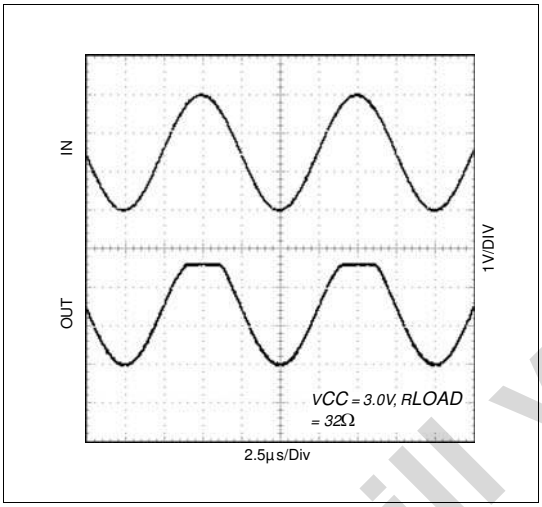
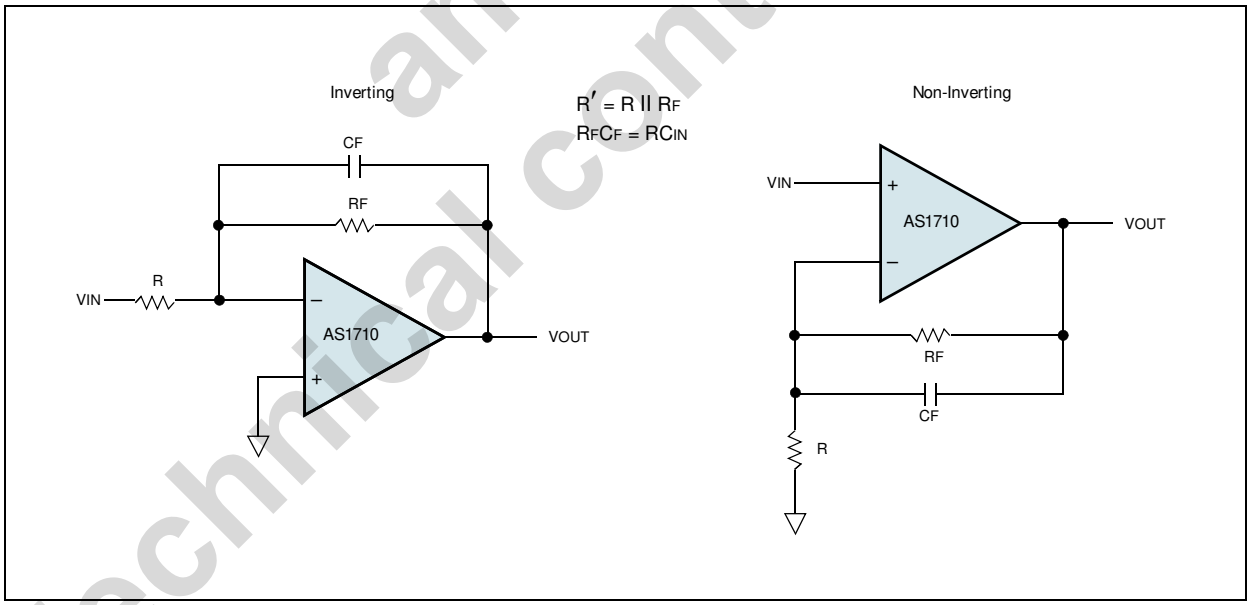


Note: The absolute maximum ratings (see page 3) for power dissipation and output short-circuit duration (10s, max) must be adhered to since the output current can exceed 200mA (see Typical Operating Characteristics on page 6).

8.5 Input Capacitance

The parallel-connected differential input stages for rail-to-rail operation results in relatively large input capacitance CIN (6pF typ). This introduces a pole at frequency $(2\pi R'C_{IN})^{-1}$, where R' is the parallel combination of the gain-setting resistors for the inverting or non-inverting amplifier configuration (Figure 25). If the pole frequency is less than or comparable to the unity-gain bandwidth (10MHz), the phase margin is reduced, and the amplifier exhibits degraded AC performance through either ringing in the step response or sustained oscillations.

Figure 25. Inverting and Non-inverting Amplifiers with Feedback Compensation



The pole frequency is 10MHz when $R' = 2k\Omega$. To maximize stability, $R' << 2k\Omega$ is recommended.

To improve step response when $R' > 2k\Omega$, connect a small capacitor (CF) between the inverting input and output. CF can be calculated by:

$$CF = 6(R/RF)\ [pf] \qquad (EQ\ 6)$$

Where:

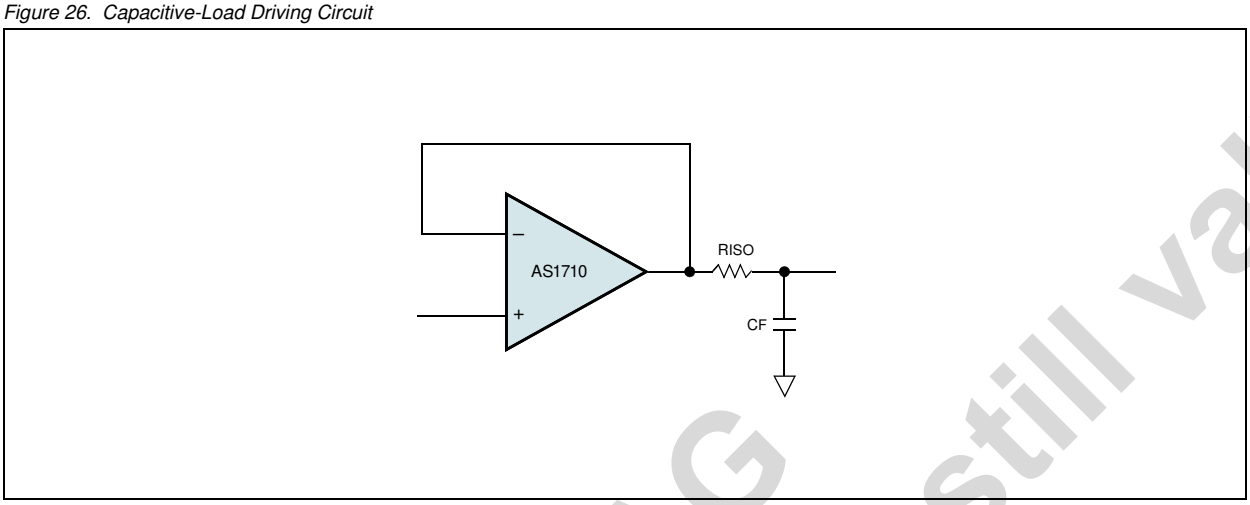
RF is the feedback resistor.
R is the gain-setting resistor.

8.6 Driving Capacitive Loads

The AS1710/AS1712 amplifiers have a high tolerance for capacitive loads, and are stable with capacitive loads up to 100pF.

Figure 26 shows a typical non-inverting capacitive-load driving circuit in the unity-gain configuration.

Figure 26. Capacitive-Load Driving Circuit



Note: Resistor RISO improves the circuit's phase margin by isolating the load capacitor from the AS1710/AS1712 output.

8.7 Power-Up

The AS1710/AS1712 typically settle within 5µs after power-up.

8.8 Shutdown

When SHDNN (not included in B versions) is pulled low, supply current drops to 0.5µA (per amplifier, VDD = 2.7V), the amplifiers are disabled, and their outputs are driven to VSS. Because the outputs are actively driven to VSS in shutdown, any pull-up resistor on the output causes a current drain from the supply.

Note: Pulling SHDNN high enables the amplifier. In the AS1712 the amplifiers shutdown in pairs.

When exiting shutdown, there is a 6µs delay before the amplifier output becomes active.

8.9 Power Supplies and Layout

The AS1710/AS1712 can operate from a single 2.7 to 5.5V supply or from dual ±1.35 to ±2.5V supplies. Good design improves device performance by decreasing the amount of stray capacitance at the op-amp inputs/outputs.

- For single-supply operation, bypass the power supply with a 0.1µF ceramic capacitor.
- For dual-supply operation, bypass each supply to ground.
- Decrease stray capacitance by placing external components close to the op-amp pins, minimizing trace and lead lengths.

9 Package Drawings and Markings

The devices are available in a SC70-5, SC70-6, and TQFN-16 (3x3mm) package.
