

Thermal Monitor

FEATURES

- On-Chip Temperature Transducer
- Temperature Comparator Gives Threshold Temperature Alarm
- Power Reference Permits Airflow Diagnostics
- Precision 2.5V Power Reference Permits Airflow Diagnostics
- Transducer Output is Easily Scaled for Increased Sensitivity
- Low 2.5mA Quiescent Current

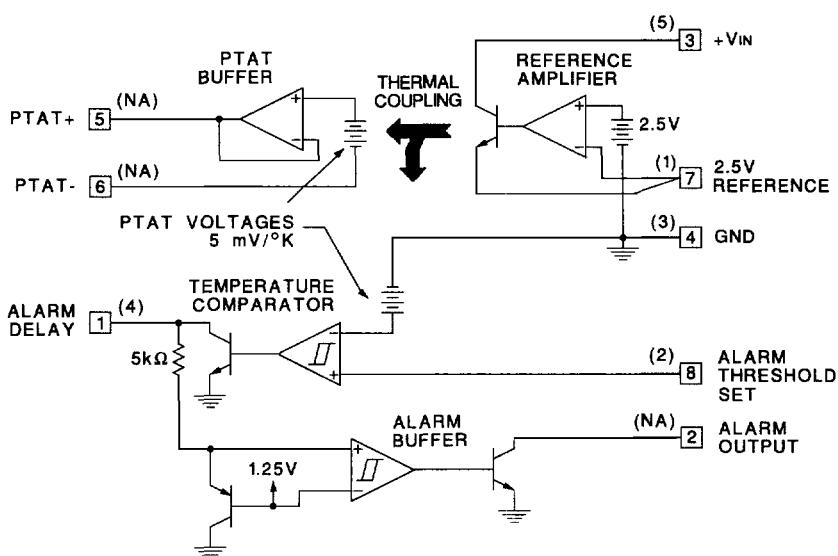

DESCRIPTION

The UC1730 family of integrated circuit devices are designed to be used in a number of thermal monitoring applications. Each IC combines a temperature transducer, precision reference, and temperature comparator allowing the device to respond with a logic output if temperatures exceed a user programmed level. The reference on these devices is capable of supplying in excess of 250mA of output current – by setting a level of power dissipation the rise in die temperature will vary with airflow past the package, allowing the IC to respond to airflow conditions.

These devices come in an 8-Pin DIP, plastic or ceramic, a 5-Pin TO-220 or a PLCC-20 version. In the 8-Pin version, a PTAT (proportional to absolute temperature) output reports die temperature directly. This output is configured such that its output level can be easily scaled up with two external gain resistors. A second PTAT source is internally referenced to the temperature comparator. The other input to this comparator can then be externally programmed to set a temperature threshold. When this temperature threshold is exceeded an alarm delay output is activated. Following the activation of the delay output, a separate open collector output is turned on. The delay pin can be programmed with an external RC to provide a time separation between activation of the delay pin and the alarm pin, permitting shutdown diagnostics in applications where the open collector outputs of multiple parts are wire OR'ed together.

The 5-Pin version in the TO-220 package is well suited for monitoring heatsink temperatures. Enhanced airflow sensitivities can be obtained with this package by mounting the device to a small heatsink in the airstream. This version of the device does not include the PTAT output or the open collector alarm output.

APPLICATIONS AND OPERATION INFORMATION (Cont.)

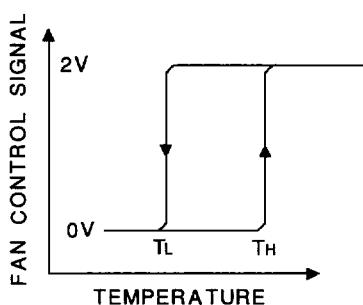

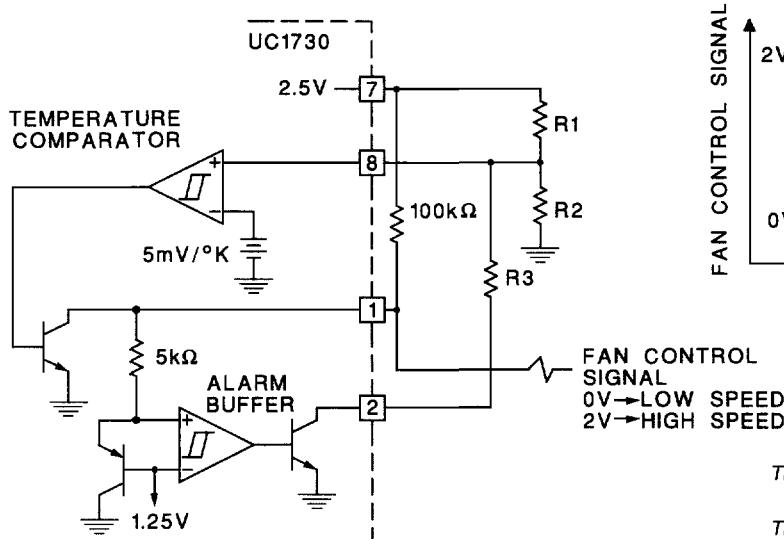

Setting a Temperature Threshold

$$\text{Temperature Threshold } ({}^\circ\text{C}) = \left(\frac{2.5V}{0.005} \right) \times \frac{R2}{R1+R2} - 273.15$$

Note: For airflow monitoring a power dissipation level can be set with a resistive load, R_L , on the reference output. $P_D = (+ V_{IN} - 2.5V)^2/R_L$.

Dual Speed Fan Control

$$T_H({}^\circ\text{C}) = \frac{2.5V}{0.005} \times \frac{R2}{R1+R2} - 273.15$$

$$T_L({}^\circ\text{C}) = \frac{2.5V}{0.005} \times \frac{R3}{R1+R3} - 273.15$$

$$\text{Where: } RX = R2 \times \frac{R3}{R2 + R3}$$
