
8-bit ultra-low-power microcontroller with up to 8-Kbyte Flash memory, multifunction timers, comparators, UART, SPI, I2C

Datasheet - production data

Features

- Main microcontroller features
 - Supply voltage range 1.8 V to 3.6 V
 - Low power consumption (Halt: 0.3 μ A, Active-halt: 0.8 μ A, Dynamic Run: 150 μ A/MHz)
 - STM8 Core with up to 16 CISC MIPS throughput
 - Temp. range: -40 to 125 $^{\circ}$ C
- Memories
 - 8 Kbytes of Flash program including up to 2 Kbytes of data EEPROM
 - Error correction code (ECC)
 - Flexible write and read protection modes
 - In-application and in-circuit programming
 - Data EEPROM capability
 - 1.5 Kbytes of static RAM
- Clock management
 - Internal 16 MHz RC with fast wakeup time (typ. 4 μ s)
 - Internal low consumption 38 kHz RC driving both the IWDG and the AWU
- Reset and supply management
 - Ultra-low power POR/PDR
 - Three low-power modes: Wait, Active-halt, Halt
- Interrupt management
 - Nested interrupt controller with software priority control
 - Up to 6 external interrupt sources
- I/Os
 - Up to 6 I/Os, all mappable on external interrupt vectors
 - I/Os with programmable input pull-ups, high sink/source capability and one LED driver infrared output
- Peripherals
 - Two 16-bit general purpose timers (TIM2 and TIM3) with up and down counter and 1 channel (used as IC, OC, PWM)
 - One 8-bit timer (TIM4) with 7-bit prescaler
 - Infrared remote control (IR)
 - Independent watchdog
 - Auto-wakeup unit
 - Beeper timer with 1, 2 or 4 kHz frequencies
 - SPI synchronous serial interface
 - Fast I2C Multimaster/slave 400 kHz
 - UART with fractional baud rate generator
 - 2 comparators with 1 input each
- Development support
 - Hardware single wire interface module (SWIM) for fast on-chip programming and non intrusive debugging

1 Introduction

This datasheet provides the STM8L001J3 pinout, ordering information, mechanical and electrical device characteristics.

For complete information on the STM8L001J3 microcontroller memory, registers and peripherals, please refer to the *STM8L001xx, STM8L101xx microcontroller family* reference manual (RM0013).

The STM8L001J3 devices are members of the STM8L low-power 8-bit family. They are referred to as low-density devices in the *STM8L001xx, STM8L101xx microcontroller family* reference manual (RM0013) and in the *How to program STM8L and STM8AL Flash program memory and data EEPROM* programming manual (PM0054).

All devices of the SM8L Series provide the following benefits:

- Reduced system cost
 - 8 Kbytes of low-density embedded Flash program memory including up to 2 Kbytes of data EEPROM
 - High system integration level with internal clock oscillators and watchdogs.
 - Smaller battery and cheaper power supplies.
- Low power consumption and advanced features
 - Up to 16 MIPS at 16 MHz CPU clock frequency
 - Less than 150 $\mu\text{A}/\text{MHz}$, 0.8 μA in Active-halt mode, and 0.3 μA in Halt mode
 - Clock gated system and optimized power management
- Short development cycles
 - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
 - Full documentation and a wide choice of development tools
- Product longevity
 - Advanced core and peripherals made in a state-of-the art technology
 - Product family operating from 1.8 V to 3.6 V supply.

2 Description

The STM8L001J3 low-power microcontroller features the enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive in-application debugging and ultra fast Flash programming.

All STM8L001J3 microcontrollers feature low power low-voltage single-supply program Flash memory. The 8-Kbyte devices embed data EEPROM.

The STM8L001J3 low power microcontroller is based on a generic set of state-of-the-art peripherals. The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

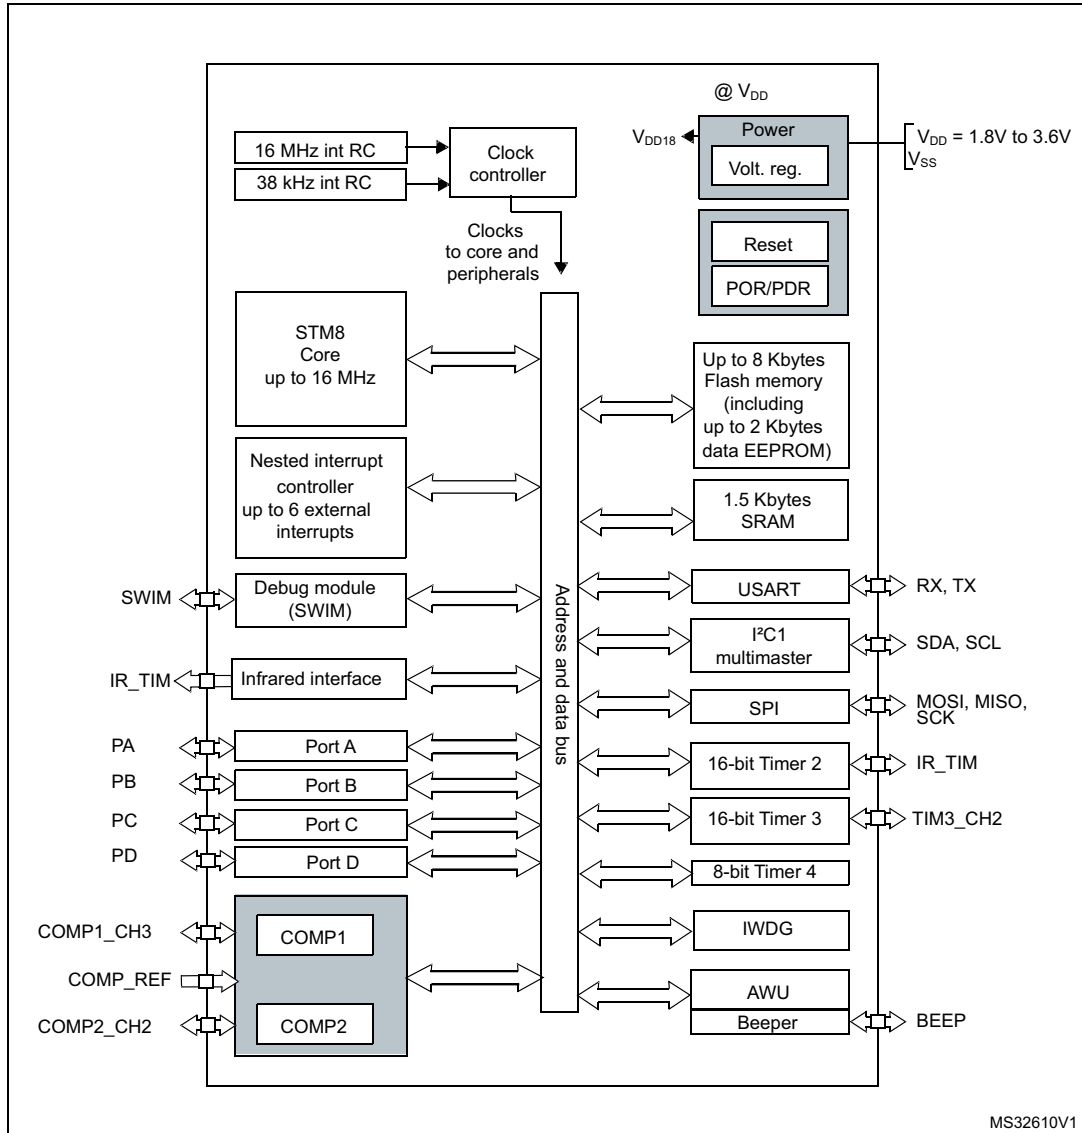

All STM8L low power products are based on the same architecture with the same memory mapping and a coherent pinout.

Table 1. STM8L001J3 device feature summary

Features	STM8L001J3
Flash	8 Kbytes of Flash program memory including up to 2 Kbytes of Data EEPROM
RAM	1.5 Kbytes
Peripheral functions	Independent watchdog (IWDG), Auto-wakeup unit (AWU), Beep, Serial peripheral interface (SPI), Inter-integrated circuit (I2C), Universal synchronous / asynchronous receiver / transmitter (USART), 2 comparators, Infrared (IR) interface
Timers	Two 16-bit timers, one 8-bit timer
Operating voltage	1.8 to 3.6 V
Operating temperature	-40 to +125 °C
Packages	SO8N

3 Product overview

Figure 1. STM8L001J3 device block diagram

Legend:

- AWU: Auto-wakeup unit
- Int. RC: internal RC oscillator
- I²C: Inter-integrated circuit multimaster interface
- POR/PDR: Power on reset / power down reset
- SPI: Serial peripheral interface
- SWIM: Single wire interface module
- USART: Universal synchronous / asynchronous receiver / transmitter
- IWDG: Independent watchdog

3.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It features 21 internal registers, 20 addressing modes including indexed, indirect and relative addressing, and 80 instructions.

3.2 Development tools

Development tools for the STM8 microcontrollers include:

- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

3.3 Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, also CPU operation can be monitored in real-time by means of shadow registers.

Recommendations for SWIM pin (pin#1)

As the NRST pin is not available on this device, if the SWIM pin should be used with the I/O pin functionality, it is recommended to add a ~5 seconds delay in the firmware before changing the functionality on the pin with SWIM functions. This action allows the user to set the device into SWIM mode after the device power on and to be able to reprogram the device. If the pin with SWIM functionality is set to I/O mode immediately after the device reset, the device is unable to connect through the SWIM interface and it gets locked forever. This initial delay can be removed in the final (locked) code.

If the initial delay is not acceptable for the application there is the option that the firmware reenables the SWIM pin functionality under specific conditions such as during firmware startup or during application run. Once that this procedure is done, the SWIM interface can be used for the device debug/programming.

3.4 Interrupt controller

The STM8L001J3 features a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 26 interrupt vectors with hardware priority
- Up to 6 external interrupt sources on 6 vectors
- Trap and reset interrupts.

3.5 Memory

The STM8L001J3 devices have the following main features:

- 1.5 Kbytes of RAM
- The EEPROM is divided into two memory arrays (see the *STM8L001xx, STM8L101xx microcontroller family* reference manual (RM0013) for details on the memory mapping):
 - 8 Kbytes of low-density embedded Flash program including up to 2 Kbytes of data EEPROM. Data EEPROM and Flash program areas can be write protected independently by using the memory access security mechanism (MASS).
 - 64 option bytes (one block) of which 5 bytes are already used for the device.

Error correction code is implemented on the EEPROM.

Recommendation for the device's programming:

The device's 8 Kbytes program memory is not empty on virgin devices; there is code loop implemented on the reset vector. It is recommended to keep valid code loop in the device to avoid the program execution from an invalid memory address (which would be any memory address out of 8 Kbytes program memory space).

If the device's program memory is empty (0x00 content), it displays the behavior described below:

- After the power on, the “empty” code is executed (0x0000 opcodes = instructions: NEG (0x00, SP)) until the device reaches the end of the 8 Kbytes program memory (the end address = 0x9FFF).
It takes around 4 milliseconds to reach the end of the 8 Kbytes memory space @2 MHz HSI clock.
- Once the device reaches the end of the 8 Kbytes program memory, the program continues and code from a non-existing memory is fetched and executed.

The reading of non-existing memory is a random content which can lead to the execution of invalid instructions.

The execution of invalid instructions generates a software reset and the program starts again. A reset can be generated every 4 milliseconds or more.

Only the “connect on-the-fly” method can be used to program the device through the SWIM interface. The “connect under-reset” method cannot be used because the NRST pin is not available on this device.

The “connect on-the-fly” mode can be used while the device is executing code, but if there is a device reset (by software reset) during the SWIM connection, this connection is aborted and it must be performed again from the debug tool. Note that the software reset occurrence can be of every 4 milliseconds, making it difficult to successfully connect to the device's debug tool (there is practically only one successful connection trial for every 10 attempts). Once that a successful connection is reached, the device can be programmed with a valid firmware without problems; therefore it is recommended that device is never erased and that it contains always a valid code loop.

3.6 Low power modes

To minimize power consumption, the product features three low power modes:

- Wait mode: CPU clock stopped, selected peripherals at full clock speed.
- Active-halt mode: CPU and peripheral clocks are stopped. The programmable wakeup time is controlled by the AWU unit.
- Halt mode: CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. Wakeup is triggered by an external interrupt.

3.7 Voltage regulators

The STM8L001J3 embeds an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes: main voltage regulator mode (MVR) and low power voltage regulator mode (LPVR). When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

3.8 Clock control

The STM8L001J3 embeds a robust clock controller. It is used to distribute the system clock to the core and the peripherals and to manage clock gating for low power modes. This system clock is a 16-MHz High Speed Internal RC oscillator (HSI RC), followed by a programmable prescaler.

In addition, a 38 kHz low speed internal RC oscillator is used by the independent watchdog (IWDG) and Auto-wakeup unit (AWU).

3.9 Independent watchdog

The independent watchdog (IWDG) peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 38 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure.

3.10 Auto-wakeup counter

The auto-wakeup (AWU) counter is used to wakeup the device from Active-halt mode.

3.11 General purpose and basic timers

STM8L001J3 devices contain two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

16-bit general purpose timers

The 16-bit timers consist of 16-bit up/down auto-reload counters driven by a programmable prescaler. They perform a wide range of functions, including:

- Time base generation
- Measuring the pulse lengths of input signals (input capture)
- Generating output waveforms (output compare, PWM and One pulse mode)
- Interrupt capability on various events (capture, compare, overflow, break, trigger)

8-bit basic timer

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow.

3.12 Beeper

The STM8L001J3 devices include a beeper function used to generate a beep signal in the range of 1, 2 or 4 kHz when the LSI clock is operating at a frequency of 38 kHz.

3.13 Infrared (IR) interface

The STM8L001J3 devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

3.14 Comparators

The STM8L001J3 features two zero-crossing comparators (COMP1 and COMP2) sharing the same current bias and voltage reference. The voltage reference can be internal (comparison with ground) or external (comparison to a reference pin voltage).

Each comparator is connected to 4 channels, which can be used to generate interrupt, timer input capture or timer break. Their polarity can be inverted.

3.15 USART

The USART interface (USART) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

3.16 SPI

The serial peripheral interface (SPI) provides half/ full duplex synchronous serial communication with external devices. It can be configured as the master and in this case it provides the communication clock (SCK) to the external slave device. The interface can also operate in multi-master configuration.

3.17 I2C

The inter-integrated circuit (I2C) bus interface is designed to serve as an interface between the microcontroller and the serial I2Cbus. It provides multi-master capability, and controls all I2C bus-specific sequencing, protocol, arbitration and timing. It manages standard and fast speed modes.

4 Pin description

Figure 2. STM8L001J3 SO8N pinout

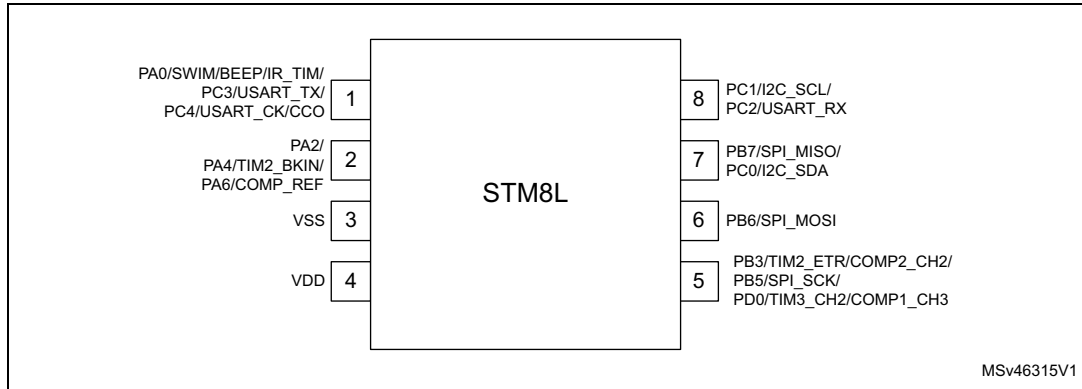

Table 2. Legend/abbreviation for table 4

Type	I= input, O = output, S = power supply	
Level	Input	CM = CMOS
	Output	HS = high sink/source (20 mA)
Port and control configuration	Input	float = floating, wpu = weak pull-up
	Output	T = true open drain, OD = open drain, PP = push pull
Reset state	Bold X (pin state after reset release). Unless otherwise specified, the pin state is the same during the reset phase (i.e. "under reset") and after internal reset release (i.e. at reset state).	

Table 3. STM8L001J3 pin description

Pin number	Pin name	Type	Input			Output			Main function (after reset)	Alternate function
			Floating	WPU	Ext. interrupt	High sink / source	OD	PP

	PC2/USART_RX	I/O	X	X	X	HS	X	X	Port C2	USART receive

1. The PA0 pin is in input pull-up during the reset phase and after internal reset release. This PA0 default state influences all the GPIOs connected in parallel on pin number 1 (PC3, PC4).
2. High sink LED driver capability available on PA0.
3. In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to V_{DD} are not implemented). Although PC0/PC1 itself is a true open drain GPIO with its respective internal circuitry and characteristics, V_{IN} maximum of the pin number 7 and pin number 8 is limited by the standard GPIO (PB7 or PC2) which is also bonded to the same pin number.

Slope control of all GPIO pins can be programmed except true open drain pins which by default is limited to 2 MHz.

Note: *The PA1, PA3, PA5, PB0, PB1, PB2, PB4, PC5, PC6, PD1, PD2, PD3, PD4, PD5, PD6 and PD7 GPIOs should be configured after device reset, by user software into the in output push-pull mode with output-low state to reduce device consumption and to improve EMC immunity. Those GPIOs are not connected to pins and after device reset are in input floating mode. To configure PA1 pin in output push-pull mode refer to Section "Configuring NRST/PA1 pin as general purpose output" in the STM8L001xx, STM8L101xx microcontroller family reference manual (RM0013).*

Note: *As several pins provide a connection to multiple GPIOs, the mode selection for any of those GPIOs impacts all the other GPIOs connected to the same pin. The user is responsible for the proper setting of the GPIO modes in order to avoid conflicts between GPIOs bonded to the same pin (including their alternate functions). For example, pull-up enabled on PA0 is also seen on PC3 and PC4. Push-pull configuration of PA2 is also seen on PA4 and PA6, etc.*

5 Memory and register map

Figure 3. Memory map

1. [Table 4](#) lists the boundary addresses for each memory size. The top of the stack is at the RAM end address.
2. Refer to [Table 6](#) for an overview of hardware register mapping, to [Table 5](#) for details on I/O port hardware registers, and to [Table 7](#) for information on CPU/SWIM/debug module controller registers.

Table 4. Flash and RAM boundary addresses

Memory area	Size	Start address	End address
RAM	1.5 Kbytes	0x00 0000	0x00 05FF
Flash program memory	8 Kbytes	0x00 8000	0x00 9FFF

26	SPI	End of Transfer	Yes	Yes	Yes	Yes ⁽¹⁾	0x00 8070

Table 8. Interrupt mapping (continued)

IRQ No.	Source block	Description	Wakeup from Halt mode	Wakeup from Active-halt mode	Wakeup from Wait (WFI mode)	Wakeup from Wait (WFE mode)	Vector address
27	USART	Transmission complete/transmit data register empty	-	-	Yes	Yes ⁽¹⁾	0x00 8074
28	USART	Receive Register DATA FULL/overrun/idle line detected/parity error	-	-	Yes	Yes ⁽¹⁾	0x00 8078
29	I2C	I2C interrupt ⁽²⁾	Yes	Yes	Yes	Yes ⁽¹⁾	0x00 807C

1. In WFE mode, this interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. Refer to Section *Wait for event (WFE) mode* in the *STM8L001xx, STM8L101xx microcontroller family* reference manual (RM0013).
2. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated row of the memory.

All option bytes can be modified only in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 9](#) for details on option byte addresses.

Refer to the *How to program STM8L and STM8AL Flash program memory and data EEPROM programming manual (PM0054)* and the *STM8 SWIM communication protocol and debug module user manual (UM0470)* for information on SWIM programming procedures.

Table 9. Option bytes

Addr.	Option name	Option byte No.	Option bits								Factory default setting
			7	6	5	4	3	2	1	0	
0x4800	Read-out protection (ROP)	OPT1	ROP[7:0]								0x00
0x4807	-	-	Reserved								0x00
0x4802	UBC (User Boot code size)	OPT2	UBC[7:0]								0x00
0x4803	DATASIZE	OPT3	DATASIZE[7:0]								0x00
0x4808	Independent watchdog option	OPT4 [1:0]	Reserved					IWDG _HALT	IWDG _HW	0x00	

Table 10. Option byte description

OPT1	<p>ROP[7:0] Memory readout protection (ROP) 0xAA: Enable readout protection (write access via SWIM protocol) Refer to Read-out protection section in the <i>STM8L001xx, STM8L101xx microcontroller family reference manual (RM0013)</i> for details.</p>
OPT2	<p>UBC[7:0] Size of the user boot code area 0x00: no UBC 0x01-0x02: UBC contains only the interrupt vectors. 0x03: Page 0 and 1 reserved for the interrupt vectors. Page 2 is available to store user boot code. Memory is write protected ... 0x7F - Page 0 to 126 reserved for UBC, memory is write protected Refer to User boot area (UBC) section in the <i>STM8L001xx, STM8L101xx microcontroller family reference manual (RM0013)</i> for more details. UBC[7] is forced to 0 internally by HW.</p>

Table 10. Option byte description (continued)

OPT3	<p>DATASIZE[7:0] Size of the data EEPROM area</p> <p>0x00: no data EEPROM area</p> <p>0x01: 1 page reserved for data storage from 0x9FC0 to 0x9FFF</p> <p>0x02: 2 pages reserved for data storage from 0x9F80 to 0x9FFF</p> <p>...</p> <p>0x20: 32 pages reserved for data storage from 0x9800 to 0x9FFF</p> <p>Refer to Data EEPROM (DATA) section in the <i>STM8L001xx, STM8L101xx microcontroller family</i> reference manual (RM0013) for more details.</p> <p>DATASIZE[7:6] are forced to 0 internal by HW.</p>
OPT4	<p>IWDG_HW: <i>Independent watchdog</i></p> <p>0: Independent watchdog activated by software</p> <p>1: Independent watchdog activated by hardware</p>
	<p>IWDG_HALT: <i>Independent window watchdog reset on Halt/Active-halt</i></p> <p>0: Independent watchdog continues running in Halt/Active-halt mode</p> <p>1: Independent watchdog stopped in Halt/Active-halt mode</p>

Caution: After a device reset, read access to the program memory is not guaranteed if address 0x4807 is not programmed to 0x00.

8 Electrical parameters

8.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS} .

8.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^\circ\text{C}$ and $T_A = T_A \text{ max}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ($\text{mean} \pm 3\sigma$).

8.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^\circ\text{C}$, $V_{DD} = 3\text{ V}$. They are given only as design guidelines and are not tested.

8.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

8.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 4](#).

Figure 4. Pin loading conditions

MS32617V1

8.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 5](#).

Figure 5. Pin input voltage

8.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 11: Voltage characteristics](#), [Table 12: Current characteristics](#) and [Table 13: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. The device mission profile is compliant with the JEDEC JESD47 qualification standard; extended mission profiles are available on demand.

Table 11. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD} - V_{SS}$	External supply voltage	-0.3	4.0	V
V_{IN}	Input voltage on any pin ⁽¹⁾	$V_{SS} - 0.3$	$V_{DD} + 0.3$	
V_{ESD}	Electrostatic discharge voltage	see Absolute maximum ratings (electrical sensitivity) on page 51		-

1. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.

Table 12. Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDD}	Total current into V_{DD} power line (source)	80	mA
I_{VSS}	Total current out of V_{SS} ground line (sink)	80	
I_{IO}	Output current sunk by IR_TIM pin (with high sink LED driver capability)	80	
	Output current sunk by any other I/O and control pin	25	
	Output current sourced by any I/Os and control pin	-25	
$I_{INJ(PIN)}$	Injected current on any pin ⁽¹⁾	±5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) ⁽²⁾	±25	

- $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.
- When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 13. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-65 to +150	°C
T_J	Maximum junction temperature	150	

8.3 Operating conditions

Subject to general operating conditions for V_{DD} and T_A .

8.3.1 General operating conditions

Table 14. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{MASTER}^{(1)}$	Master clock frequency	$1.8\text{ V} \leq V_{DD} < 3.6\text{ V}$	0	16	MHz
V_{DD}	Standard operating voltage	-	1.8	3.6	V
$P_D^{(2)}$	Power dissipation at $T_A = 125\text{ °C}$ for suffix 3 devices	SO8N	-	49	mW
T_A	Temperature range	$1.8\text{ V} \leq V_{DD} < 3.6\text{ V}$ (3 suffix version)	- 40	125	°C
T_J	Junction temperature range	$-40\text{ °C} \leq T_A \leq 125\text{ °C}$ (3 suffix version)	- 40	130	°C

1. $f_{MASTER} = f_{CPU}$

2. To calculate $P_{Dmax}(T_A)$ use the formula given in thermal characteristics $P_{Dmax} = (T_{Jmax} - T_A) / \Theta_{JA}$ with T_{Jmax} in this table and Θ_{JA} in table "Thermal characteristics"

8.3.2 Power-up / power-down operating conditions

Table 15. Operating conditions at power-up / power-down

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{VDD}	V_{DD} rise time rate	-	20	-	1300	$\mu\text{s/V}$
t_{TEMP}	Reset release delay	V_{DD} rising	-	1	-	ms
$V_{POR}^{(1)(2)}$	Power on reset threshold	-	1.35	-	1.65 ⁽³⁾	V
$V_{PDR}^{(1)(2)}$	Power down reset threshold	-	1.40	-	1.60	V

1. Guaranteed by characterization results.
2. Correct device reset during power on sequence is guaranteed when $t_{VDD[\text{max}]}$ is respected. External reset circuit is recommended to ensure correct device reset during power down, when $V_{PDR} < V_{DD} < V_{DD[\text{min}]}$.
3. Tested in production.

8.3.3 Supply current characteristics

Total current consumption

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled except if explicitly mentioned.

Subject to general operating conditions for V_{DD} and T_A .

Table 16. Total current consumption in Run mode ⁽¹⁾

Symbol	Parameter	Conditions ⁽²⁾		Typ	Max ⁽³⁾	Unit
I _{DD (Run)}	Supply current in Run mode ^{(4) (5)}	Code executed from RAM	f _{MASTER} = 2 MHz	0.39	0.60	mA
			f _{MASTER} = 4 MHz	0.55	0.70	
			f _{MASTER} = 8 MHz	0.90	1.20	
			f _{MASTER} = 16 MHz	1.60	2.10 ⁽⁶⁾	
		Code executed from Flash	f _{MASTER} = 2 MHz	0.55	0.70	
			f _{MASTER} = 4 MHz	0.88	1.80	
			f _{MASTER} = 8 MHz	1.50	2.50	
			f _{MASTER} = 16 MHz	2.70	3.50	

1. Based on characterization results, unless otherwise specified.
2. All peripherals off, V_{DD} from 1.8 V to 3.6 V, HSI internal RC osc., f_{CPU}=f_{MASTER}
3. Maximum values are given for T_A = -40 to 125 °C.
4. CPU executing typical data processing.
5. An approximate value of I_{DD(Run)} can be given by the following formula:

$$I_{DD(Run)} = f_{MASTER} \times 150 \mu A/MHz + 215 \mu A.$$
6. Tested in production.

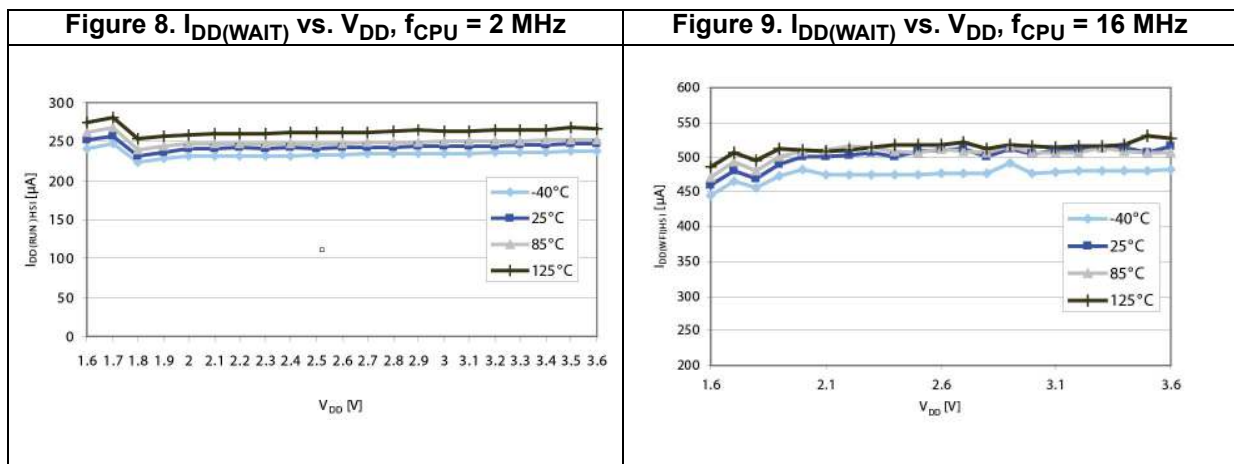

1. Typical current consumption measured with code executed from Flash.

Table 17. Total current consumption in Wait mode⁽¹⁾

Symbol	Parameter	Conditions		Typ	Max ⁽²⁾	Unit
I _{DD (Wait)}	Supply current in Wait mode	CPU not clocked, all peripherals off, HSI internal RC osc.	f _{MASTER} = 2 MHz	245	400	μA
			f _{MASTER} = 4 MHz	300	450	
			f _{MASTER} = 8 MHz	380	600	
			f _{MASTER} = 16 MHz	510	800	

1. Based on characterization results, unless otherwise specified.
2. Maximum values are given for T_A = -40 to 125 °C.

1. Typical current consumption measured with code executed from Flash.

Table 18. Total current consumption and timing in Halt and Active-halt mode at $V_{DD} = 1.8\text{ V to }3.6\text{ V}^{(1)(2)}$

Symbol	Parameter	Conditions	Typ	Max	Unit	
$I_{DD(AH)}$	Supply current in Active-halt mode	LSI RC osc. (at 37 kHz)	$T_A = -40\text{ °C to }25\text{ °C}$	0.8	2	μA
			$T_A = 55\text{ °C}$	1	2.5	μA
			$T_A = 85\text{ °C}$	1.4	3.2	μA
			$T_A = 105\text{ °C}$	2.9	7.5	μA
			$T_A = 125\text{ °C}$	5.8	13	μA
$I_{DD(WUFAH)}$	Supply current during wakeup time from Active-halt mode	-	-	2	-	mA
$t_{WU(AH)}^{(3)}$	Wakeup time from Active-halt mode to Run mode	$f_{CPU} = 16\text{ MHz}$	4	6.5	μs	
$I_{DD(Halt)}$	Supply current in Halt mode		$T_A = -40\text{ °C to }25\text{ °C}$	0.35	1.2 ⁽⁴⁾	μA
			$T_A = 55\text{ °C}$	0.6	1.8	μA
			$T_A = 85\text{ °C}$	1	2.5 ⁽⁴⁾	μA
			$T_A = 105\text{ °C}$	2.5	6.5	μA
			$T_A = 125\text{ °C}$	5.4	12 ⁽⁴⁾	μA
$I_{DD(WUFH)}$	Supply current during wakeup time from Halt mode		2	-	mA	
$t_{WU(Halt)}^{(3)}$	Wakeup time from Halt mode to Run mode	$f_{CPU} = 16\text{ MHz}$	4	6.5	μs	

- $T_A = -40$ to 125 °C , no floating I/O, unless otherwise specified.
- Guaranteed by characterization results.
- Measured from interrupt event to interrupt vector fetch.
To get t_{WU} for another CPU frequency use $t_{WU}(FREQ) = t_{WU}(16\text{ MHz}) + 1.5 (T_{FREQ} - T_{16\text{ MHz}})$.
The first word of interrupt routine is fetched 5 CPU cycles after t_{WU} .
- Tested in production.

Figure 10. Typ. $I_{DD(Halt)}$ vs. V_{DD} , $f_{CPU} = 2\text{ MHz}$ and 16 MHz

- Typical current consumption measured with code executed from Flash.

Current consumption of on-chip peripherals

Measurement made for $f_{MASTER} =$ from 2 MHz to 16 MHz

Table 19. Peripheral current consumption

Symbol	Parameter	Typ. $V_{DD} = 3.0 V$	Unit
$I_{DD}(TIM2)$	TIM2 supply current ⁽¹⁾	9	μA/MHz
$I_{DD}(TIM3)$	TIM3 supply current ⁽¹⁾	9	
$I_{DD}(TIM4)$	TIM4 timer supply current ⁽¹⁾	4	
$I_{DD}(USART)$	USART supply current ⁽²⁾	7	
$I_{DD}(SPI)$	SPI supply current ⁽²⁾	4	
$I_{DD}(I2C1)$	I2C supply current ⁽²⁾	4	
$I_{DD}(COMP)$	Comparator supply current ⁽²⁾	20	μA

1. Data based on a differential I_{DD} measurement between all peripherals off and a timer counter running at 16 MHz. The CPU is in Wait mode in both cases. No IC/OC programmed, no I/O pin toggling. not tested in production.
2. Data based on a differential I_{DD} measurement between the on-chip peripheral when kept under reset and not clocked and the on-chip peripheral when clocked and not kept under reset. The CPU is in Wait mode in both cases. No I/O pin toggling. Not tested in production.

8.3.4 Clock and timing characteristics

Internal clock sources

Subject to general operating conditions for V_{DD} and T_A .

High speed internal RC oscillator (HSI)

Table 20. HSI oscillator characteristics ⁽¹⁾

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSI}	Frequency	$V_{DD} = 3.0 V$	-	16	-	MHz
ACC_{HSI}	Accuracy of HSI oscillator (factory calibrated)	$V_{DD} = 3.0 V, T_A = 25\text{ }^\circ C$	-5	-	5	%
		$1.8 V \leq V_{DD} \leq 3.6 V, -40\text{ }^\circ C \leq T_A \leq 125\text{ }^\circ C$	-7.5 ⁽²⁾	-	7.5 ⁽²⁾	%
$I_{DD}(HSI)$	HSI oscillator power consumption	-	-	70	100 ⁽²⁾	μA

1. $V_{DD} = 3.0 V, T_A = -40$ to $125\text{ }^\circ C$ unless otherwise specified.
2. Guaranteed by characterization results.

Low speed internal RC oscillator (LSI)

Table 21. LSI oscillator characteristics (1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	Frequency	-	26	38	56	kHz
$f_{drift(LSI)}$	LSI oscillator frequency drift(2)	$0\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$	-12	-	11	%

- $V_{DD} = 1.8\text{ V to }3.6\text{ V}$, $T_A = -40\text{ to }125\text{ }^{\circ}\text{C}$ unless otherwise specified.
- For each individual part, this value is the frequency drift from the initial measured frequency.

Figure 11. Typical LSI RC frequency vs. V_{DD}

8.3.5 Memory characteristics

$T_A = -40\text{ to }125\text{ }^{\circ}\text{C}$ unless otherwise specified.

Table 22. RAM and hardware registers

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{RM}	Data retention mode (1)	Halt mode (or Reset)	1.65	-	-	V

- Minimum supply voltage without losing data stored in RAM (in Halt mode or under Reset) or in hardware registers (only in Halt mode). Guaranteed by characterization results.

Flash memory

Table 23. Flash program memory

Symbol	Parameter	Conditions	Min	Typ	Max (1)	Unit
V_{DD}	Operating voltage (all modes, read/write/erase)	$f_{MASTER} = 16\text{ MHz}$	1.8	-	3.6	V
t_{prog}	Programming time for 1- or 64-byte (block) erase/write cycles (on programmed byte)	-	-	6	-	ms
	Programming time for 1- to 64-byte (block) write cycles (on erased byte)	-	-	3	-	ms

Table 23. Flash program memory (continued)

Symbol	Parameter	Conditions	Min	Typ	Max (1)	Unit
I _{prog}	Programming/ erasing consumption	T _A =+25 °C, V _{DD} = 3.0 V	-	0.7	-	mA
		T _A =+25 °C, V _{DD} = 1.8 V	-		-	
t _{RET}	Data retention (program memory) after 10k erase/write cycles at T _A = +85 °C	T _{RET} = 55 °C	20 ⁽¹⁾	-	-	years
	Data retention (data memory) after 10k erase/write cycles at T _A = +85 °C	T _{RET} = 55 °C	20 ⁽¹⁾	-	-	
	Data retention (data memory) after 300k erase/write cycles at T _A = +125 °C	T _{RET} = 85 °C	1 ⁽¹⁾	-	-	
N _{RW}	Erase/write cycles (program memory)	See notes (1)(2)	100 ⁽¹⁾	-	-	cycles
	Erase/write cycles (data memory)	See notes (1)(3)	100 ⁽¹⁾⁽⁴⁾	-	-	kcycles

1. Guaranteed by characterization results.
2. Retention guaranteed after cycling is 10 years at 55 °C.
3. Retention guaranteed after cycling is 1 year at 55 °C.
4. Data based on characterization performed on the whole data memory (2 Kbytes).

8.3.6 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 24. I/O static characteristics (1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V _{IL}	Input low level voltage ⁽²⁾	All I/Os	V _{SS} -0.3	-	0.3 x V _{DD}	V
V _{IH}	Input high level voltage ⁽²⁾	All I/Os	0.70 x V _{DD}	-	V _{DD} +0.3	V
V _{hys}	Schmitt trigger voltage hysteresis ⁽³⁾	Standard I/Os	-	200	-	mV
		True open drain I/Os	-	250	-	
I _{lkg}	Input leakage current ⁽⁴⁾	V _{SS} ≤ V _{IN} ≤ V _{DD} Standard I/Os	-	-	50 ⁽⁵⁾	nA
		V _{SS} ≤ V _{IN} ≤ V _{DD} True open drain I/Os	-	-	200 ⁽⁵⁾	
		V _{SS} ≤ V _{IN} ≤ V _{DD} PA0 with high sink LED driver capability	-	-	200 ⁽⁵⁾	
R _{PU}	Weak pull-up equivalent resistor ⁽⁶⁾	V _{IN} = V _{SS}	30	45	60	kΩ
C _{IO} ⁽⁷⁾	I/O pin capacitance	-	-	5 ⁽⁸⁾	-	pF

1. $V_{DD} = 3.0\text{ V}$, $T_A = -40\text{ to }85\text{ }^\circ\text{C}$ unless otherwise specified.
2. Guaranteed by characterization results.
3. Hysteresis voltage between Schmitt trigger switching levels. Guaranteed by characterization results.
4. The max. value may be exceeded if negative current is injected on adjacent pins.
5. Not tested in production.
6. R_{PU} pull-up equivalent resistor based on a resistive transistor (corresponding I_{PU} current characteristics described in [Figure 14](#)).
7. Guaranteed by design.
8. Capacitance per one GPIO on pin. Complete pin capacitance depends on how many GPIOs are connected on a given pin (see [Table 3](#)). Total pin capacitance is then $N \times C_{IO}$ (where N = number of GPIOs on a given pin).

Figure 12. Typical V_{IL} and V_{IH} vs. V_{DD} (High sink I/Os)

Figure 13. Typical V_{IL} and V_{IH} vs. V_{DD} (true open drain I/Os)

Figure 14. Typical pull-up resistance R_{PU} vs. V_{DD} with $V_{IN}=V_{SS}$

Figure 15. Typical pull-up current I_{PU} vs. V_{DD} with $V_{IN}=V_{SS}$

Output driving current

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 25. Output driving current (High sink ports)

I/O Type	Symbol	Parameter	Conditions	Min	Max	Unit
Standard	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +2 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$	-	0.45	V
			$I_{IO} = +2 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$	-	0.45	V
			$I_{IO} = +10 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$	-	1.2	V
	$V_{OH}^{(2)}$	Output high level voltage for an I/O pin	$I_{IO} = -2 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$	$V_{DD}-0.45$	-	V
			$I_{IO} = -1 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$	$V_{DD}-0.45$	-	V
			$I_{IO} = -10 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$	$V_{DD}-1.2$	-	V

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 12](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .
2. The I_{IO} current sourced must always respect the absolute maximum rating specified in [Table 12](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VDD} .

Table 26. Output driving current (true open drain ports)

I/O Type	Symbol	Parameter	Conditions	Min	Max	Unit
Open drain	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +3 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$	-	0.45	V
			$I_{IO} = +1 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$	-	0.45	V

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 12](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .

Table 27. Output driving current (PA0 with high sink LED driver capability)

I/O Type	Symbol	Parameter	Conditions	Min	Max	Unit
\overline{R}	$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +20 \text{ mA}$, $V_{DD} = 2.0 \text{ V}$	-	0.9	V

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 12](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .

Figure 16. Typ. V_{OL} at $V_{DD} = 3.0\text{ V}$ (High sink ports)

Figure 17. Typ. V_{OL} at $V_{DD} = 1.8\text{ V}$ (High sink ports)

Figure 18. Typ. V_{OL} at $V_{DD} = 3.0\text{ V}$ (true open drain ports)

Figure 19. Typ. V_{OL} at $V_{DD} = 1.8\text{ V}$ (true open drain ports)

Figure 20. Typ. $V_{DD} - V_{OH}$ at $V_{DD} = 3.0\text{ V}$ (High sink ports)

Figure 21. Typ. $V_{DD} - V_{OH}$ at $V_{DD} = 1.8\text{ V}$ (High sink ports)

8.3.7 Communication interfaces

Serial peripheral interface (SPI)

Unless otherwise specified, the parameters given in [Table 28](#) are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions summarized in [Section 8.3.1](#). Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 28. SPI characteristics

Symbol	Parameter	Conditions ⁽¹⁾	Min	Max	Unit
f_{SCK} $1/t_{\text{c(SCK)}}$	SPI clock frequency	Master mode	0	8	MHz
		Slave mode	0	8	
$t_{\text{r(SCK)}}$ $t_{\text{f(SCK)}}$	SPI clock rise and fall time	Capacitive load: C = 30 pF	-	30	ns
$t_{\text{su(NSS)}}^{(2)}$	NSS setup time	Slave mode	$4 \times T_{\text{MASTER}}$	-	
$t_{\text{h(NSS)}}^{(2)}$	NSS hold time	Slave mode	80	-	
$t_{\text{w(SCKH)}}^{(2)}$ $t_{\text{w(SCKL)}}^{(2)}$	SCK high and low time	Master mode, $f_{\text{MASTER}} = 8 \text{ MHz}$, $f_{\text{SCK}} = 4 \text{ MHz}$	105	145	
$t_{\text{su(MI)}}^{(2)}$ $t_{\text{su(SI)}}^{(2)}$	Data input setup time	Master mode	30	-	
		Slave mode	3	-	
$t_{\text{h(MI)}}^{(2)}$ $t_{\text{h(SI)}}^{(2)}$	Data input hold time	Master mode	15	-	
		Slave mode	0	-	
$t_{\text{a(SO)}}^{(2)(3)}$	Data output access time	Slave mode	-	$3 \times T_{\text{MASTER}}$	
$t_{\text{dis(SO)}}^{(2)(4)}$	Data output disable time	Slave mode	30	-	
$t_{\text{v(SO)}}^{(2)}$	Data output valid time	Slave mode (after enable edge)	-	60	
$t_{\text{v(MO)}}^{(2)}$	Data output valid time	Master mode (after enable edge)	-	20	
$t_{\text{h(SO)}}^{(2)}$	Data output hold time	Slave mode (after enable edge)	15	-	
$t_{\text{h(MO)}}^{(2)}$		Master mode (after enable edge)	1	-	

- Parameters are given by selecting 10-MHz I/O output frequency.
- Values based on design simulation and/or characterization results, and not tested in production.
- Min time is for the minimum time to drive the output and max time is for the maximum time to validate the data.
- Min time is for the minimum time to invalidate the output and max time is for the maximum time to put the data in Hi-Z.

Figure 22. SPI timing diagram - slave mode and CPHA = 0

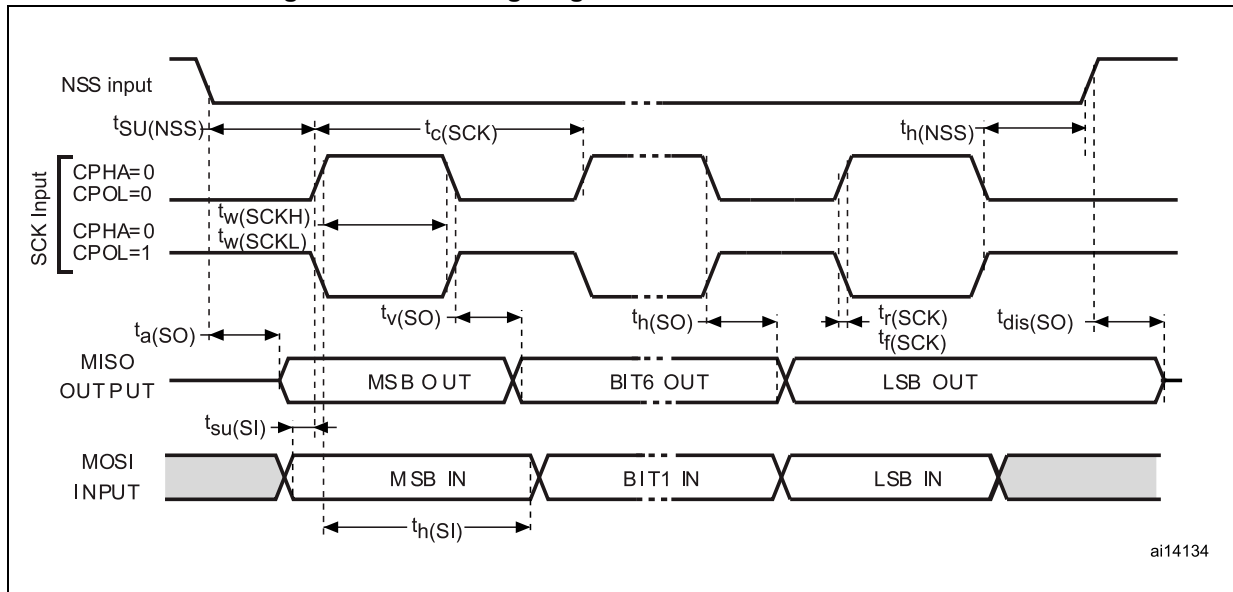

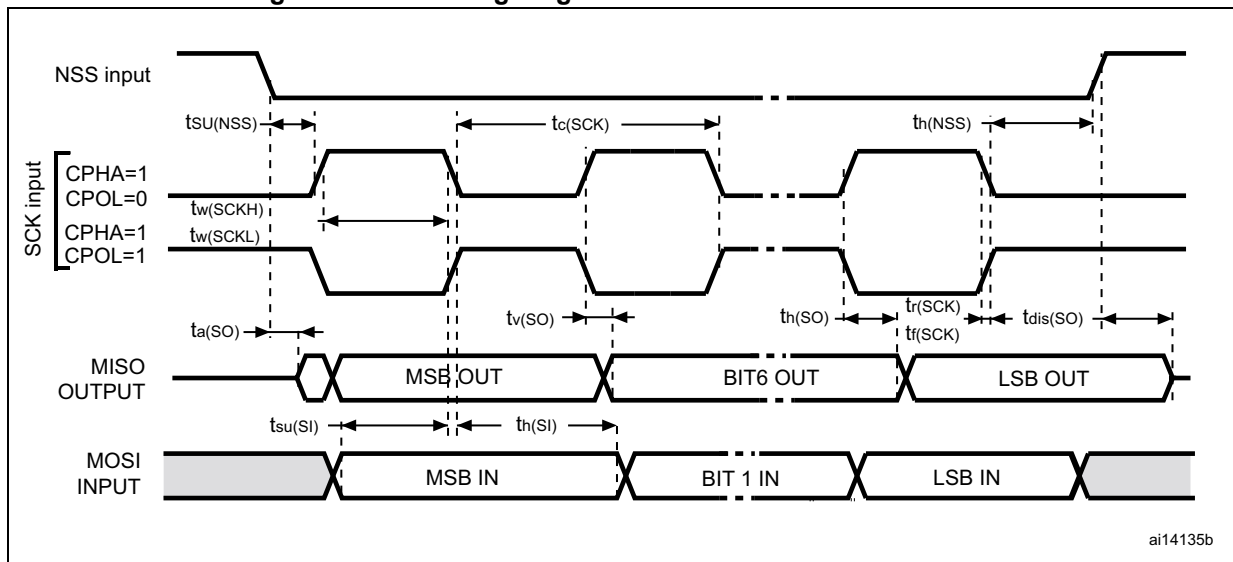

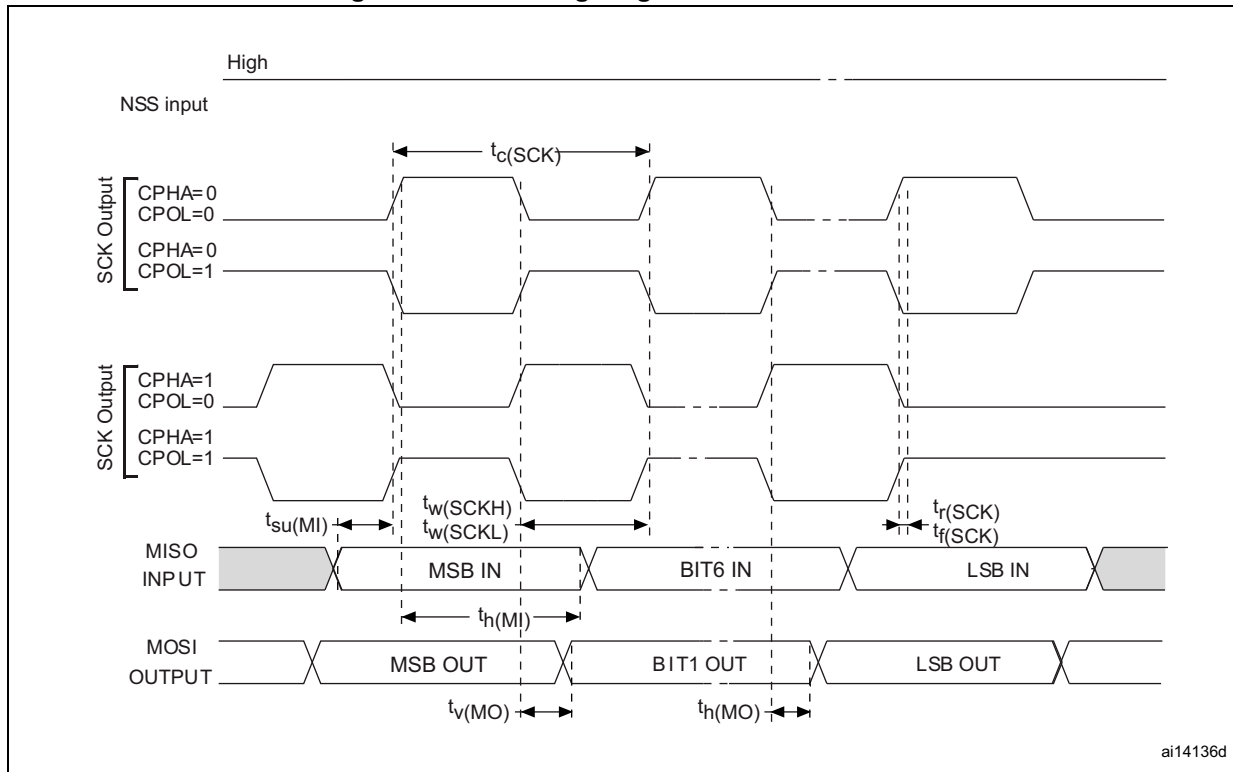

Figure 23. SPI timing diagram - slave mode and CPHA = 1⁽¹⁾

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

Figure 24. SPI timing diagram - master mode⁽¹⁾

ai14136d

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

Inter IC control interface (I2C)

Subject to general operating conditions for V_{DD} , f_{MASTER} , and T_A unless otherwise specified.

The STM8L I²C interface meets the requirements of the Standard I²C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

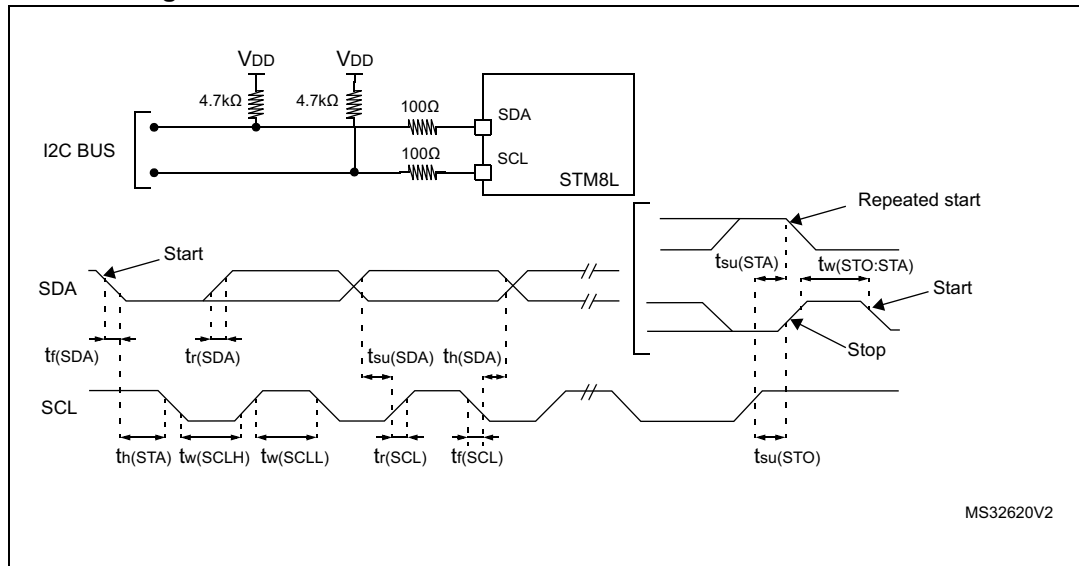

Table 29. I2C characteristics

Symbol	Parameter	Standard mode I2C		Fast mode I2C ⁽¹⁾		Unit
		Min ⁽²⁾	Max ⁽²⁾	Min ⁽²⁾	Max ⁽²⁾	
$t_{w(SCLL)}$	SCL clock low time	4.7	-	1.3	-	μs
$t_{w(SCLH)}$	SCL clock high time	4.0	-	0.6	-	
$t_{su(SDA)}$	SDA setup time	250	-	100	-	ns
$t_{h(SDA)}$	SDA data hold time	0 ⁽³⁾	-	0 ⁽⁴⁾	900 ⁽³⁾	
$t_{r(SDA)}$ $t_{r(SCL)}$	SDA and SCL rise time	-	1000	-	300	
$t_{f(SDA)}$ $t_{f(SCL)}$	SDA and SCL fall time	-	300	-	300	
$t_{h(STA)}$	START condition hold time	4.0	-	0.6	-	μs
$t_{su(STA)}$	Repeated START condition setup time	4.7	-	0.6	-	
$t_{su(STO)}$	STOP condition setup time	4.0	-	0.6	-	μs
$t_{w(STO:STA)}$	STOP to START condition time (bus free)	4.7	-	1.3	-	μs
C_b	Capacitive load for each bus line	-	400	-	400	pF

- f_{SCK} must be at least 8 MHz to achieve max fast I²C speed (400 kHz).
- Data based on standard I²C protocol requirement, not tested in production.
- The maximum hold time of the START condition has only to be met if the interface does not stretch the low period of SCL signal.
- The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL).

Note: For speeds around 200 kHz, achieved speed can have $\pm 5\%$ tolerance
 For other speed ranges, achieved speed can have $\pm 2\%$ tolerance
 The above variations depend on the accuracy of the external components used.

Figure 25. Typical application with I2C bus and timing diagram ⁽¹⁾

1. Measurement points are done at CMOS levels: 0.3 x V_{DD} and 0.7 x V_{DD}.

8.3.8 Comparator characteristics

Table 30. Comparator characteristics

Symbol	Parameter	Conditions	Min ⁽¹⁾	Typ	Max ⁽¹⁾	Unit
V _{IN(COMP_REF)}	Comparator external reference	-	-0.1	-	V _{DD} -1.25	V
V _{IN}	Comparator input voltage range	-	-0.25	-	V _{DD} +0.25	V
V _{offset} ⁽²⁾	Comparator offset error	-	-	-	± 20	mV
t _{START}	Startup time (after BIAS_EN)	-	-	-	3 ⁽¹⁾	µs
I _{DD(COMP)}	Analog comparator consumption	-	-	-	25 ⁽¹⁾	µA
	Analog comparator consumption during power-down	-	-	-	60 ⁽¹⁾	nA
t _{propag} ⁽²⁾	Comparator propagation delay	100-mV input step with 5-mV overdrive, input rise time = 1 ns	-	-	2 ⁽¹⁾	µs

1. Guaranteed by design.

2. The comparator accuracy depends on the environment. In particular, the following cases may reduce the accuracy of the comparator and must be avoided:
- Negative injection current on the I/Os close to the comparator inputs
 - Switching on I/Os close to the comparator inputs
 - Negative injection current on not used comparator input.
 - Switching with a high dV/dt on not used comparator input.
- These phenomena are even more critical when a big external serial resistor is added on the inputs.

8.3.9 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Prequalification trials:

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring. Refer to application note *Software techniques for improving microcontrollers EMC performance* (AN1015).

Table 31. EMS data

Symbol	Parameter	Conditions	Level/Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	SO8N, $V_{DD} = 3.3\text{ V}$	TBD
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	SO8N, $V_{DD} = 3.3\text{ V}$, f_{HSI}	TBD
		SO8N, $V_{DD} = 3.3\text{ V}$, $f_{HSI}/2$	TBD

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm SAE J 1752/3 which specifies the board and the loading of each pin.

Table 32. EMI data ⁽¹⁾

Symbol	Parameter	Conditions	Monitored frequency band	Max vs.	Unit
				16 MHz	
S _{EMI}	Peak level	V _{DD} = 3.6 V, T _A = +25 °C, SO8N conforming to IEC61967-2	0.1 MHz to 30 MHz	TBD	dBμV
			30 MHz to 130 MHz	TBD	
			130 MHz to 1 GHz	TBD	
			SAE EMI Level	TBD	-

1. Not tested in production.

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin).

This test conforms to the JESD22-A114A/A115A standard.

Table 33. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Maximum value ⁽¹⁾	Unit
V _{ESD(HBM)}	Electrostatic discharge voltage (human body model)	T _A = +25 °C	TBD	V
V _{ESD(CDM)}	Electrostatic discharge voltage (charge device model)		TBD	

1. Guaranteed by characterization results.

Static latch-up

- **LU:** 2 complementary static tests are required on 10 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 34. Electrical sensitivities

Symbol	Parameter	Class
LU	Static latch-up class	TBD

8.4 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 14: General operating conditions on page 33](#).

The maximum chip-junction temperature, T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in watts. This is the maximum chip internal power.
- $P_{I/Omax}$ represents the maximum power dissipation on output pins where:
 $P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma ((V_{DD} - V_{OH}) * I_{OH})$,
 taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Table 35. Thermal characteristics⁽¹⁾

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient SO8N	102	°C/W

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

Failure analysis and guarantee

The small number of pins available induces limitations on failure analysis depth in case of isolated symptom, typically with an impact lower than 0.1%. Please contact your sales office for additional information for any failure analysis. STMicroelectronics will make a feasibility study for investigation based on failure rate and symptom description prior to responsibility endorsement.

9.1 SO8N package information

Figure 26. SO8N – 8-lead, 4.9 x 6 mm, plastic small outline, 150 mils body width, package outline

1. Values in inches are converted from mm and rounded to four decimal digits.

Figure 27. SO8N – 8-lead 4.9 x 6 mm, plastic small outline, 150 mils body width, package recommended footprint

- 1. Dimensions are expressed in millimeters.
- 2. Drawing is not to scale.

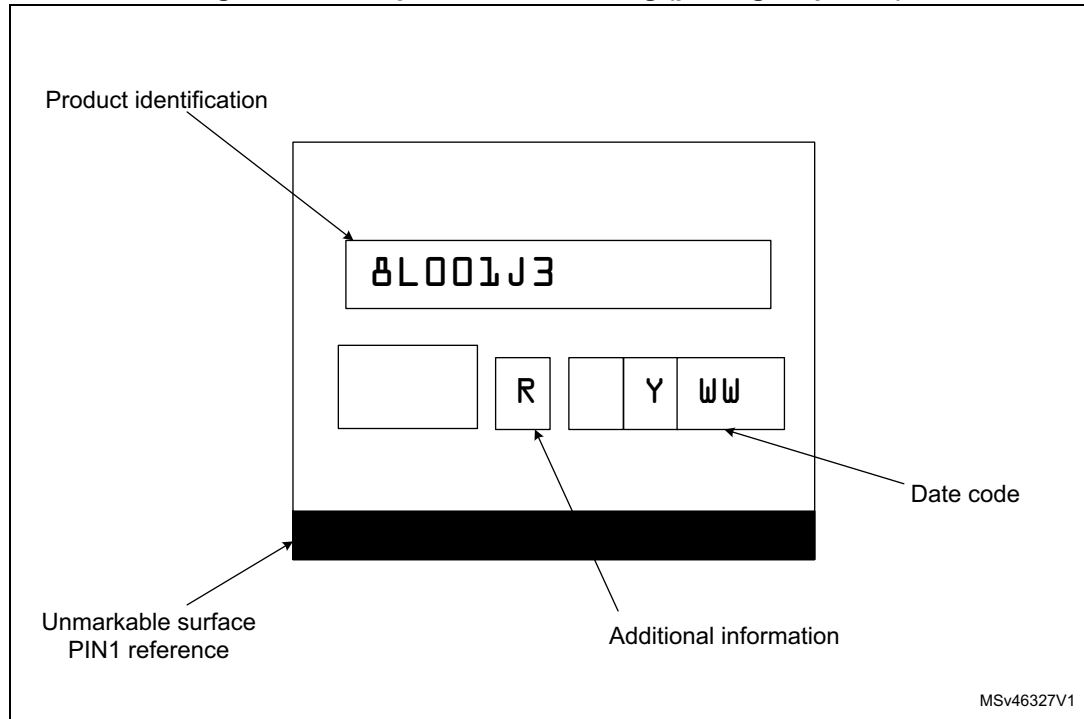

Device marking for SO8N – 8-lead 4.9 x 6 mm, plastic small outline, 150 mils body width

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

Figure 28. Example of SO8N marking (package top view)

1. Parts marked as ES or E or accompanied by an Engineering Sample notification letter are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

10 Ordering information

Table 37. Ordering information scheme

Example:	STM8	L	001	J	3	M	3
Device family							
STM8 microcontroller							
Family type							
L = Low power							
Sub family type							
00x = Value line sub-family							
001 = Low density							
Pin count							
J = 8 pins							
Program memory size							
3 = 8 Kbytes							
Package							
M = SO8N							
Temperature range							
3 = -40°C to 125°C							

1. For a list of available options (e.g. memory size, package) and order-able part numbers or for further information on any aspect of this device, please go to www.st.com or contact the ST Sales Office nearest to you.

11 Revision history

Table 38. Document revision history

Date	Revision	Changes
06-Jun-2017	1	Initial release.
04-Oct-2017	2	Updated: – Document's confidentiality level to <i>public</i> – Section 1: Introduction – Section 2: Description – Section 9: Package information – Figure 23: SPI timing diagram - slave mode and CPHA = 1⁽¹⁾ – Figure 24: SPI timing diagram - master mode⁽¹⁾ – Figure 25: Typical application with I2C bus and timing diagram (1)
04-Jul-2018	3	Updated: – Recommendations for SWIM pin (pin#1) on Section 3.3: Single wire data interface (SWIM) and debug module
10-Sep-2020	4	Deleted: – Figure: Typical HSI frequency vs. VDD – Figure: Typical HSI accuracy vs. temperature, VDD = 3 V – Figure: Typical HSI accuracy vs. temperature, VDD = 1.8 V to 3.6 V Updated: – Table 20: HSI oscillator characteristics
