13 Amp 5V/3.3V Input Adjustable **Integrated Switching Regulator**

SLTS099

(Revised 6/30/2000)

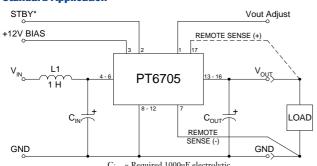

- +3.3V/5V input (+12V Bias)
- Adjustable Output Voltage
- 90% Efficiency
- Differential Remote Sense
- 17-pin Space-Saving Package
- Solderable Copper Case
- Short Circuit Protection

The PT6705 is a series of low-cost, high-performance, 13 Amp Integrated Switching Regulators (ISRs) housed in a unique, space-saving 17-pin SIP package. The PT6705 will operate off either a 5V or 3.3V input bus to provide a low-voltage power source for the industry's latest highspeed, low-voltage µPs, and bus drivers.

The PT6705 incorporates internal short circuit protection, and requires a +12V/50mA bias input for operation.

Standard Application

C_{in} = Required 1000μF electrolytic Cout= Required 330µF electrolytic L1 = Optional 1µH input choke

Pin-Out Information

Pin	Function	Pin Function
1	V _{out} Adjust	10 GND
2	STBY*	11 GND
3	+12V Bias Input	12 GND
4	V _{in}	13 V _{out}
5	Vin	14 V _{out}
6	Vin	15 V _{out}
7	Remote Sense Gnd (4)	16 V _{out}
8	GND	17 Remote Sense Vout
9	GND	For STBY* pin
		* 11.1

- (1) The ISR-will operate down to no load with reduced specifications.
 (2) For operation below 0°C, Cin and Cout must have stable characteristics. Use either low ESR tantalum or Oscon® capacitors.
- (3) See Safe Operating Area curves, or contact the factory for appropriate derating.
- (4) If the remote sense ground is not used, pin 7 must be connected to pin 8 for optimum output voltage accuracy.

Filter/Capacitor Selection

Output Capacitors: The PT6705 requires a minimum ouput capacitance of 330µF for proper operation. The maximum allowable output capacitance is 15,000µF. Input Filter: An input filter is optional for most applications. The input inductor must be sized to handle 10ADC with a typical value of 1µH. The input capacitance must be rated for a minimum of 2.0Arms of ripple current. For transient or dynamic load applications, additional capacitance may be required.

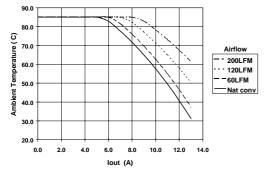

CHARACTERISTICS TYPICAL

All Models, $V_{in} = 5.0V$ (Note A)

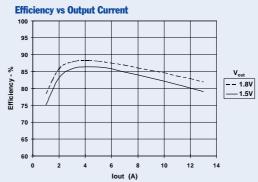

Safe Operating Area, PT6705, $V_{in} = 5.0V$ (Note B)

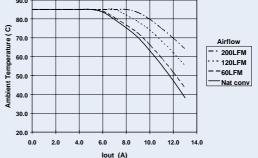

PT6707, PT6708, V_{in} =3.3V (Note A)

Power Dissipation vs Output Current Watts --1.8V --1.5V Ë

Safe Operating Area, PT6707, V_{in} =3.3V (Note B) 80.0

Note A: All data in the above graphs has been developed from actual products tested at 25°C. This data is considered typical for the ISR.

Note B: SOA curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures.

PT6705/6715 Series

Adjusting the Output Voltage of the PT6705 and PT6715 Excalibur™ Converters

Both the PT6705 and PT6715 series ISRs are non-programmable versions of the PT6700 Excalibur™ family of converters. These regulators have a fixed output voltage, which may be adjusted higher or lower than the factory trimmed pre-set voltage using a single external resistor. Table 1 gives the allowable adjustment range for each model as V₂ (min) and V₂ (max).

Adjust Up: An increase in the output voltage is obtained by adding a resistor R2, between pin 1 (Vo adjust) and pin 7 (-Remote Sense).

Adjust Down: Add a resistor (R1), between pin 1 (V₀ adjust) and pin 17 (+Remote Sense).

Refer to Figure 1 and Table 2 for both the placement and value of the required resistor, either (R1) or R2 as appropriate.

Notes:

- 1. Use only a single 1% resistor in either the (R1) or R2 location. Place the resistor as close to the ISR as
- 2. Never connect capacitors from Vo adjust to either GND, Vout, or the Remote Sense pins. Any capacitance added to the Vo adjust pin will affect the stability of the ISR.
- 3. If the Remote Sense feature is not being used, pin 7 must be connected to pin 8 for optimum output voltage accuracy. Correspondingly the resistors (R1) and R2 may be then be connected from Vo Adjust to either Vout or GND respectively.
- 4. The PT6705 series requires a 12V external bias voltage in order to operate (see data sheet). An external bias voltage is not required for the PT6715 series.
- 5. Adjusting the output voltage of the PT6705 and PT6715 (3.3V models) higher than the factory pretrimmed output voltage may require an increase in the minimum input voltage. These two models must comply with the following requirements for V_{in}(min).

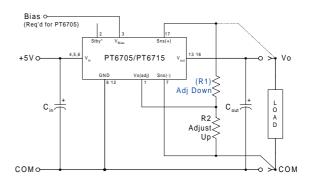

PT670x models:

 V_{in} (min) $=(V_a+1)V$

PT671x models:

= $(V_a + 1)V$ or 4.5V, whichever is greater. $V_{in}(min)$

Figure 1

The values of (R1) [adjust down], and R2 [adjust up], can also be calculated using the following formulas.

(R1) =
$$\frac{10 \cdot (V_a - 1.27)}{(V_o - V_a)} - R_s \quad k\Omega$$

$$R2 = \frac{12.7}{V_0 - V_0} - R_s \qquad k\Omega$$

Where: $V_{\stackrel{\circ}{U}_a}$ = Original output voltage

= Adjusted output voltage

= Series resistance value from Table 1
