## 1 Overview

### Application

- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays and fuses
- Most suitable for applications with high current loads, such as heating system, main switch for power distribution, start-stop power supply switch
- PWM application with low frequencies

**PG-TO263-7-8**

### Features

- One channel device
- Low Stand-by current
- Wide input voltage range (can be driven by logic levels 3.3V and 5V as well as directly by  $V_S$ )
- Electrostatic discharge protection (ESD)
- Optimized Electromagnetic Compatibility (EMC)
- Logic ground independent from load ground
- Very low leakage current on OUT pin
- Compatible to cranking pulse requirement (test pulse 4 of ISO7637 and cold start pulse in LV124)
- Embedded diagnostic functions
- Embedded protection functions
- Green Product (RoHS compliant)
- AEC Qualified

### Description

The BTS50045-1TAC is a 4.5mΩ single channel Smart High-Side Power Switch, embedded in a PG-TO-263-7-8 package, providing protective functions and diagnosis. It contains Infineon® Reversave. The power transistor is built by a N-channel power MOSFET with charge pump. It is specially designed to drive high current loads up to 40A, for applications like switched battery couplings, power distribution switches, heaters, glow plugs, in the harsh automotive environment.

Type	Package	Marking
BTS50045-1TAC	PG-TO-263-7-8	S50045C

**Table 1 Product Summary**

Parameter	Symbol	Values
Operating voltage range	$V_{S(OP)}$	8 V ... 18 V
Extended supply voltage contain dynamic undervoltage capability	$V_{S(DYN)}$	3.2 V ... 28 V
Maximum on-state resistance at $T_J = 150\text{ °C}$	$R_{DS(ON)}$	9 mΩ
Minimum nominal load current	$I_{L(nom)}$	19 A
Typical current sense differential ratio	$dk_{ILIS}$	21900
Minimum short circuit current threshold	$I_{L(OVL)}$	70 A
Maximum stand-by current for the whole device with load at $T_A = T_J = 85\text{ °C}$	$I_{S(OFF)}$	18 μA
Maximum reverse battery voltage at $T_A = 25\text{ °C}$ for 2 min	$-V_{S(REV)}$	16 V

#### Embedded Diagnostic Functions

- Proportional load current sense
- Short circuit / Overtemperature detection
- Latched status signal after short circuit or overtemperature detection

#### Embedded Protection Functions

- Infineon® Reversave: Reverse battery protection by self turn ON of power MOSFET
- Infineon® Inversave: Inverse operation robustness capability
- Secure load turn-OFF while device loss of GND connection
- Overtemperature protection with latch
- Short circuit protection with latch
- Overvoltage protection with external components
- Enhanced short circuit operation
- Infineon® SMART CLAMPING

## 2 Block Diagram

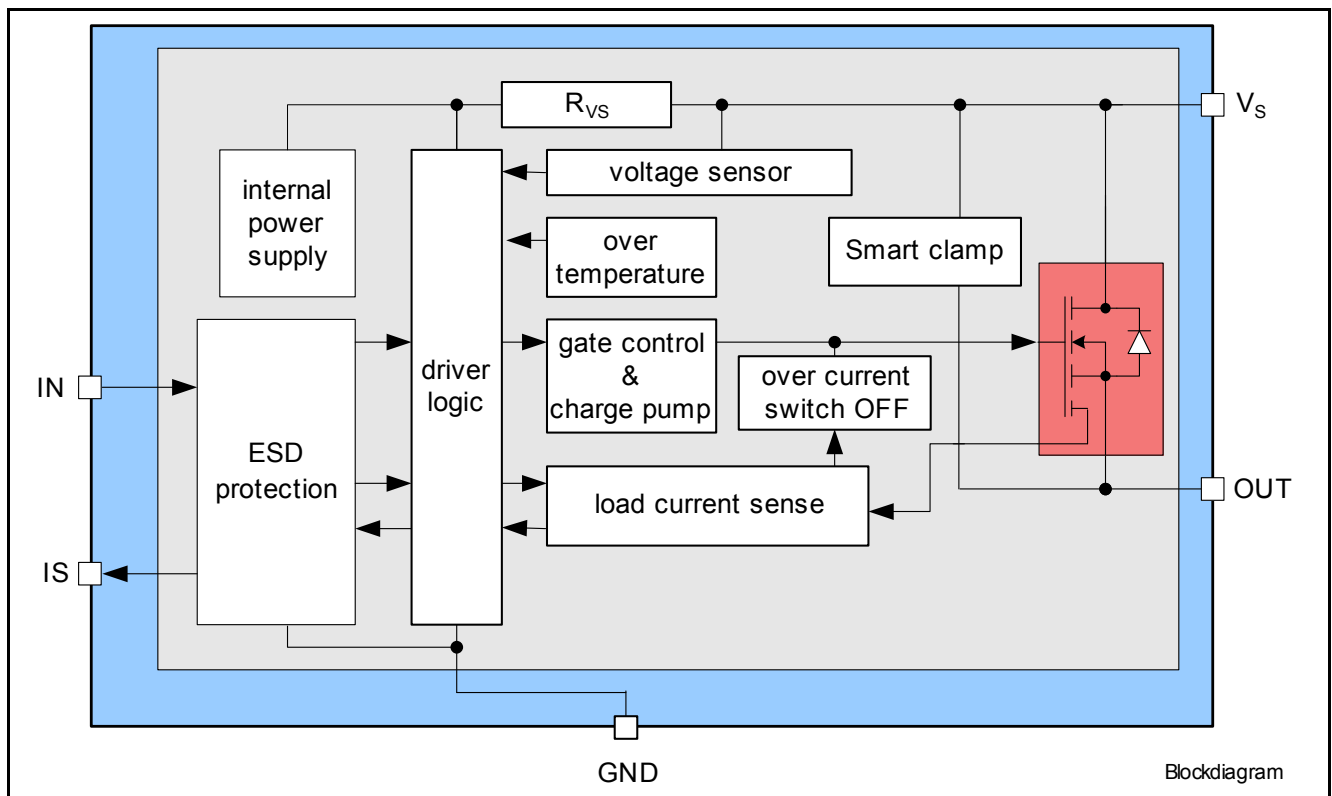

Figure 1 Block Diagram for the BTS50045-1TAC

## 3 Pin Configuration

### 3.1 Pin Assignment

Figure 2 Pin Configuration

### 3.2 Pin Definitions and Functions

Pin	Symbol	Function
1	GND	<b>GrouND</b> ; Ground connection
2	IN	<b>INput</b> ; Input signal for channel activation. HIGH active
3	IS	<b>Sense</b> ; Provides signal for diagnosis
4, Cooling tab	VS	<b>Supply Voltage</b> ; Battery voltage
5, 6, 7	OUT	<b>OUTput</b> ; Protected high side power output <sup>1)</sup>

1) All output pins are internally connected and they also have to be connected together on the PCB. Not shorting all outputs on PCB will considerably increase the ON-state resistance and decrease the current sense / overcurrent tripping accuracy. PCB traces have to be designed to withstand the maximum current.

## 4 General Product Characteristics

### 4.1 Absolute Maximum Ratings

**Table 2 Absolute Maximum Ratings <sup>1)</sup>**

$T_j = -40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$ ; (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltages							
Supply Voltage	$V_S$	-0.3	–	28	V	–	4.1.1
Reverse polarity voltage	$-V_{S(\text{REV})}$	0	–	16	V	<sup>2)</sup> $t < 2 \text{ min}$ $T_A = 25^{\circ}\text{C}$ $R_L \geq 1.0\Omega$	4.1.2
Supply voltage for load dump protection	$V_{S(\text{LD})}$	–	–	45	V	<sup>3)</sup> $R_I = 2\Omega$ $R_L = 2.2\Omega$ $R_{IS} = 1\text{k}\Omega$ $R_{IN} = 4.7\text{k}\Omega$	4.1.5
Short circuit capability							
Supply voltage for short circuit protection	$V_{S(\text{SC})}$	5	–	20	V	<sup>4)</sup> $R_{\text{ECU}} = 20\text{m}\Omega$ $L_{\text{ECU}} = 1\mu\text{H}$ $R_{\text{cable}} = 6\text{m}\Omega/\text{m}$ $L_{\text{cable}} = 1\mu\text{H}/\text{m}$ $I = 0 \text{ to } 5\text{m}$ $R, C$ as shown in <b>Figure 51</b> See <b>Chapter 5.3</b>	4.1.3
Short circuit is permanent: IN pin toggles short circuit (SC type 1)	$n_{\text{RSC1}}$	–	–	100k (Grade D)	–	<sup>5)</sup>	4.1.4
GND pin							
Current through ground pin	$I_{\text{GND}}$	-15 – <sup>6)</sup>	– –	$10^{7)}$ 15	mA	– $t \leq 2 \text{ min}$	4.1.6
Input Pin							
Voltage at IN pin	$V_{\text{IN}}$	-0.3	–	$V_S$	V	–	4.1.7
Current through IN pin	$I_{\text{IN}}$	-5 -5	– –	5 $50^{6)}$	mA	– $t \leq 2 \text{ min}$	4.1.8
Maximum retry cycle rate in fault condition	$f_{\text{fault}}$	–	–	1	Hz	–	4.1.9
Sense Pin							
Voltage at IS pin	$V_{\text{IS}}$	-0.3	–	$V_S$	V	–	4.1.10
Current through IS pin	$I_{\text{IS}}$	-15 – <sup>6)</sup>	– –	$10^{7)}$ 15	mA	– $t \leq 2 \text{ min}$	4.1.11

## General Product Characteristics

**Table 2 Absolute Maximum Ratings (cont'd)<sup>1)</sup>**
 $T_j = -40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$ ; (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Power Stage							
Maximum energy dissipation by switching off inductive load Single pulse over lifetime	$E_{AS}$	–	–	250	mJ	$V_S = 13.5V$ $I_L = I_{L(NOM)} = 19A$ $T_{J(0)} \leq 150^{\circ}C$ See <a href="#">Figure 5</a>	4.1.12
Maximum energy dissipation Repetitive pulse	$E_{AR}$	–	–	100	mJ	<sup>8)</sup> $V_S = 13.5V$ $I_L = I_{L(NOM)} = 19A$ $T_{J(0)} \leq 105^{\circ}C$ See <a href="#">Figure 5</a>	4.1.13
Maximum energy dissipation Repetitive pulse	$E_{AR(OVL)}$	–	–	100	mJ	<sup>8)</sup> $V_S = 13.5V$ $I_L = 30A$ $T_{J(0)} \leq 105^{\circ}C$ See <a href="#">Figure 5</a>	4.1.14
Average power dissipation	$P_{TOT}$	–	–	100	W	$T_C = -40^{\circ}C$ to $150^{\circ}C$	4.1.15
Voltage at OUT Pin	$V_{OUT}$	-64	–	–	V	–	4.1.21
Temperatures							
Junction Temperature	$T_J$	-40	–	150	$^{\circ}C$	–	4.1.16
Dynamic temperature increase while switching	$\Delta T_J$	–	–	60	K	See <a href="#">Chapter 5.3</a>	4.1.17
Storage Temperature	$T_{STG}$	-55	–	150	$^{\circ}C$	–	4.1.18
ESD Susceptibility							
ESD susceptibility (all pins)	$V_{ESD}$	-2	–	2	kV	HBM <sup>9)</sup>	4.1.19
ESD susceptibility OUT Pin vs. GND / $V_S$	$V_{ESD}$	-4	–	4	kV	HBM <sup>9)</sup>	4.1.20

1) Not subject to production test, specified by design.

2) The device is mounted on a FR4 2s2p board according to Jedec JESD51-2,-5,-7 at natural convection.

3)  $V_{S(LD)}$  is setup without DUT connected to the generator per ISO 7637-1.

4) In accordance to AEC Q100-012

5) In accordance to AEC Q100-012. Test aborted after 100,000 cycles. Short circuit conditions deviating from AEC Q100-012 may influence the specified short circuit cycle number in the datasheet.

6) The total reverse current (sum of  $I_{GND}$ ,  $I_{IS}$  and  $-I_{IN}$ ) is limited by  $-V_{S(REV)\_max}$  and  $R_{VS}$ .

7)  $T_C \leq 125^{\circ}\text{C}$ 

8) Equivalent to short circuit test AEC Q100-012: Grade A (for cycles &gt; 1 Mio., parameter deviations are possible; Test aborted after 10 Mio. Cycles without fails)

9) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS-001

**Notes**

- Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

**Figure 4** Maximum Single Pulse Current vs. Pulse Time,  $T_J \leq 150^\circ\text{C}$ ,  $T_{\text{amb}} = 85^\circ\text{C}$

Above diagram shows the maximum single pulse current that can be driven for a given pulse time  $t_{\text{pulse}}$ . The maximum reachable current may be smaller depending on the current limitation level. Pulse time may be limited due to thermal protection of the device.

**Figure 5** Maximum Energy Dissipation for Inductive Switch OFF,  $E_A$  vs Load Current

**Figure 6** Maximum Energy Dissipation Repetitive Pulse for Inductive Switch OFF vs Junction Temperature starting Point for Load Currents from 10A to 30A

## 4.2 Functional Range

**Table 3 Functional Range**

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Nominal operating voltage	$V_{S(OP)}$	8	–	18	V	–	4.2.1
Extended operating voltage	$V_{S(OP\_EXT)}$	5.3	–	28	V	<sup>1)</sup> $V_{IN} \geq 2.2V$ $I_L \leq I_{L(NOM)}$ $T_J \leq 25^\circ C$ Parameter deviations possible	4.2.2
		5.5	–	28	V	<sup>1)</sup> $V_{IN} \geq 2.2V$ $I_L \leq I_{L(NOM)}$ $T_J = 150^\circ C$ Parameter deviations possible	
Extended operating voltage contain short dynamic undervoltage capability	$V_{S(DYN)}$	3.2 <sup>2)</sup>	–	28	V	<sup>1)</sup> acc. to ISO7637	4.2.3
Undervoltage turn OFF voltage	$V_{S(UV\_OFF)}$	–	–	4.5	V	<sup>1)</sup> $V_{IN} \geq 2.2V$ $R_L = 270\Omega$ $V_S$ decreasing See <a href="#">Figure 19</a>	4.2.4
Undervoltage shutdown hysteresis	$V_{S(UV\_HYS)}$	–	500 <sup>1)</sup>	–	mV	$R_L = 270\Omega$ See <a href="#">Figure 19</a>	4.2.6
Slewrate at OUT	$dV_{DS}/dt$	–	–	10 <sup>1)</sup>	V/ $\mu s$	$ V_{DS}  < 3V$ See <a href="#">Chapter 5.1.4</a>	4.2.7

1) Not subject to production test. Specified by design

2)  $T_A = 25^\circ C$ ;  $R_L = 1.0\Omega$ ; pulse duration 3ms; cranking capability is depending on load and must be verified under application conditions

*Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.*

### 4.3 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to [www.jedec.org](http://www.jedec.org).

**Table 4 Thermal Resistance**

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Junction to Case	$R_{thJC}$	—	—	0.8	K/W	<sup>1)</sup>	4.3.1
Junction to Ambient	$R_{thJA(2s2p)}$	—	19	—	K/W	<sup>1)2)</sup>	4.3.2
Junction to Ambient	$R_{thJA}$	—	70	—	K/W	<sup>1)3)</sup>	4.3.3

1) Not subject to production test, specified by design.

2) Specified  $R_{thJA}$  value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The Product (Chip+Package) was simulated on a  $76.2 \times 114.3 \times 1.5$  mm board with 2 inner copper layers (2 x 70 $\mu$ m Cu, 2 x 35 $\mu$ m Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.  $T_A=25^\circ\text{C}$ . Device is dissipating 2W power.

3) Specified  $R_{thJA}$  value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 1s0p board; The Product (Chip+Package) was simulated on a  $76.2 \times 114.3 \times 1.5$  mm board with 1 inner copper layers 1x 70 $\mu$ m Cu.  $T_A=25^\circ\text{C}$ . Device is dissipating 2W power.

**Figure 7** is showing the typical thermal impedance of BTS50045-1TAC mounted according to JEDEC JESD51-2,-5,-7 at natural convection on FR4 1s0p and 2s2p boards.

**Figure 7 Typical Transient Thermal Impedance  $Z_{thJA}=f(\text{time})$  for Different PCB Conditions**

## 5 Functional Description

### 5.1 Power Stage

The power stage is built by a N-channel power MOSFET (DMOS) with charge pump.

#### 5.1.1 Output ON-State Resistance

The ON-state resistance  $R_{DS(ON)}$  depends on the supply voltage as well as the junction temperature  $T_J$ . **Figure 31** shows the dependencies in terms of temperature and supply voltage, for the typical ON-state resistance. The behavior in reverse polarity is described in **Chapter 5.3.5**.

A HIGH signal (see **Chapter 5.2**) at the input pin causes the power DMOS to switch ON with a dedicated slope, which is optimized in terms of EMC emission.

#### 5.1.2 Switching a Resistive Load

**Figure 8** shows the typical timing when switching a resistive load. The power stage has a defined switching behavior. Defined slew rates results in lowest EMC emission at minimum switching losses.

**Figure 8** Switching a Resistive Load Timing

#### 5.1.3 Switching an Inductive Load

##### 5.1.3.1 Output Clamping

When switching OFF inductive loads with high side switches, the voltage  $V_{OUT}$  drops below ground potential, because the inductance intends to continue driving the current. To prevent the destruction of the device due to high voltages, there is a Infineon® SMART CLAMPING mechanism implemented that keeps negative output voltage to a certain level ( $V_S - V_{DS(CL)}$ ). Please refer to **Figure 9** and **Figure 10** for details. Nevertheless, the maximum allowed load inductance remains limited.

**Figure 9** Output Clamp

**Figure 10** Switching an Inductance

The BTS50045-1TAC provides Infineon® SMART CLAMPING functionality. To increase the energy capability for single operation, the clamp voltage  $V_{DS(CL)}$  increases over the junction temperature  $T_j$  and load current  $I_L$ . Refer to [Figure 39](#).

### 5.1.3.2 Maximum Load Inductance

During demagnetization of inductive loads, energy has to be dissipated in the BTS50045-1TAC. This energy can be calculated with following equation:

$$E = V_{DS(CL)} \times \frac{L}{R_L} \times \left[ \frac{V_S - V_{DS(CL)}}{R_L} \times \ln \left( 1 - \frac{R_L \times I_L}{V_S - V_{DS(CL)}} \right) + I_L \right] \quad (1)$$

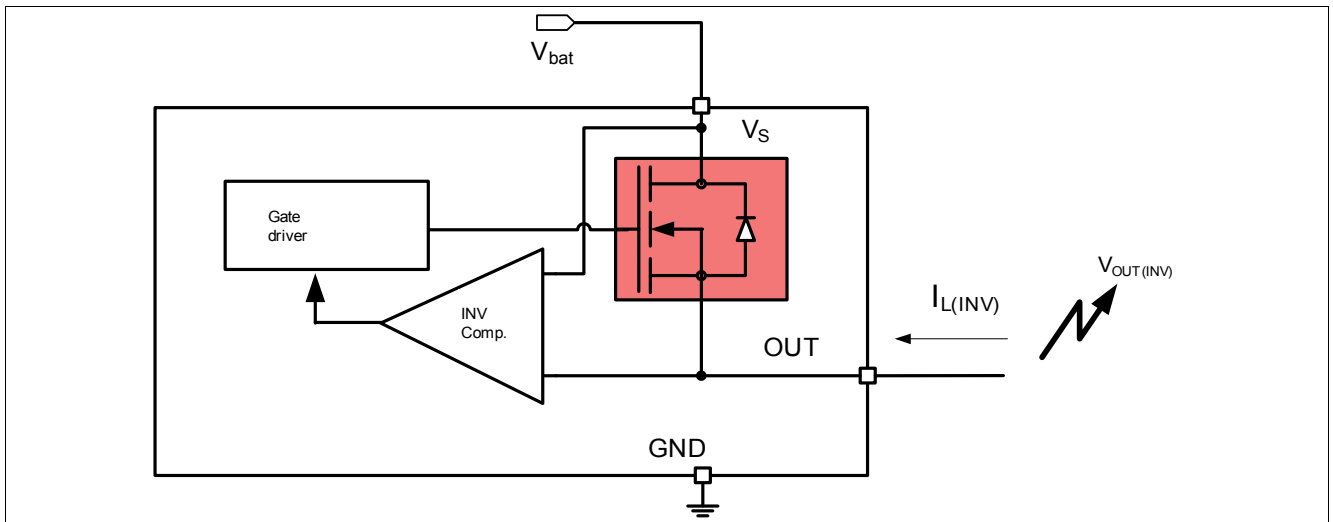

Following equation simplifies under the assumption of  $R_L = 0\Omega$ .

$$E = \frac{1}{2} \times L \times I_L^2 \times \left(1 - \frac{V_S}{V_S - V_{DS(CL)}}\right) \quad (2)$$

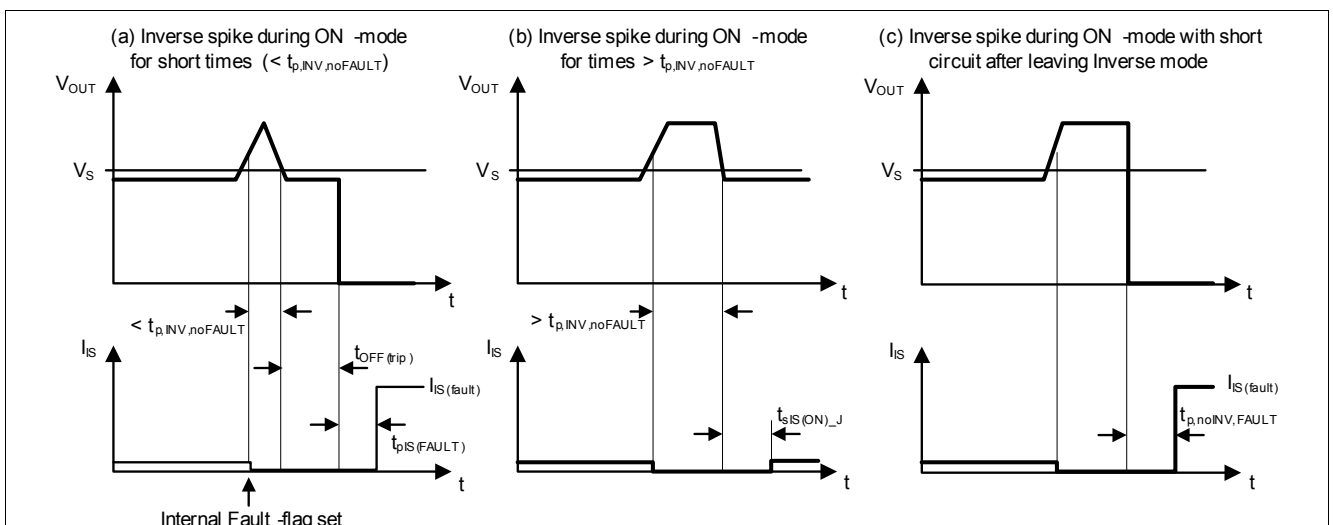

The energy, which is converted into heat, is limited by the thermal design of the component. See [Figure 5](#) for the maximum allowed energy dissipation as function of the load current.

### 5.1.4 Inverse Current Capability

In case of inverse current, meaning a voltage  $V_{OUT(INV)}$  at the output higher than the supply voltage  $V_S$ , a current  $I_{L(INV)}$  will flow from output to  $V_S$  pin via the body diode of the power transistor (please refer to [Figure 11](#)). In case the IN pin is HIGH, the power DMOS is already activated and keeps ON. In case, the input goes from "L" to "H", the DMOS will be activated. Under inverse condition, the device is not overtemperature / overload protected. The IS pin is high impedance. Due to the limited speed of INV comparator, the output voltage slope needs to be limited (see parameter 4.2.7).

**Figure 11 Inverse Current Circuitry**

**Figure 12 Inverse Behavior - Timing Diagram**

### 5.1.5 PWM Switching

For PWM switching application, a  $t_{IN(RESETDELAY)}$  parameter should be respected by defining the maximum PWM frequency (see [Figure 22](#)). The average power over time must be below the specified value (see parameter 4.1.15) and is defined as (see [Figure 13](#)):

$$P_{TOT} = (\text{switching\_ON\_energy} + \text{switching\_OFF\_energy} + I_L^2 * R_{DS(ON)} * t_{DC}) / \text{period}$$

For system with PWM switching, the maximum retry cycle ( $t_{fault}$ ) under fault condition should not be exceeded.

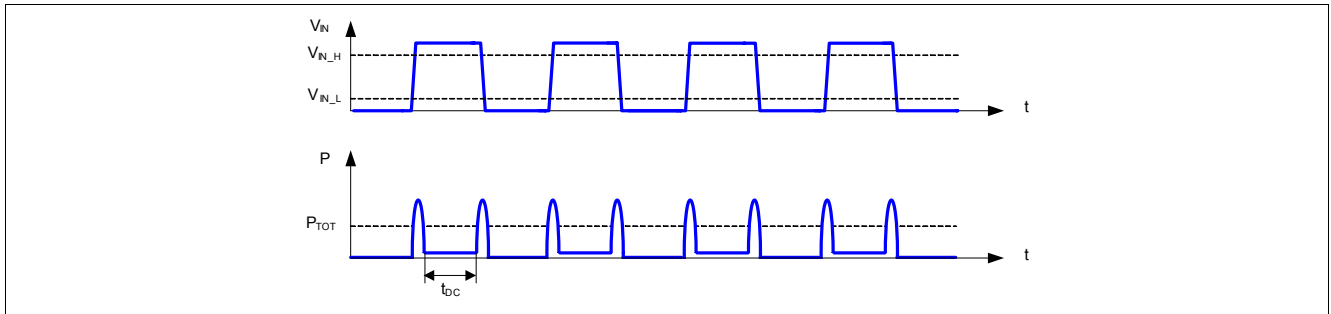

Figure 13 Switching in PWM

## 5.2 Input Pins

### 5.2.1 Input Circuitry

The input circuitry is compatible with 3.3V and 5V microcontrollers or can be directly driven by  $V_S$ . The concept of the input pin is to react to voltage threshold. With the Schmitt trigger, the output is either ON or OFF. [Figure 14](#) shows the electrical equivalent input circuitry.

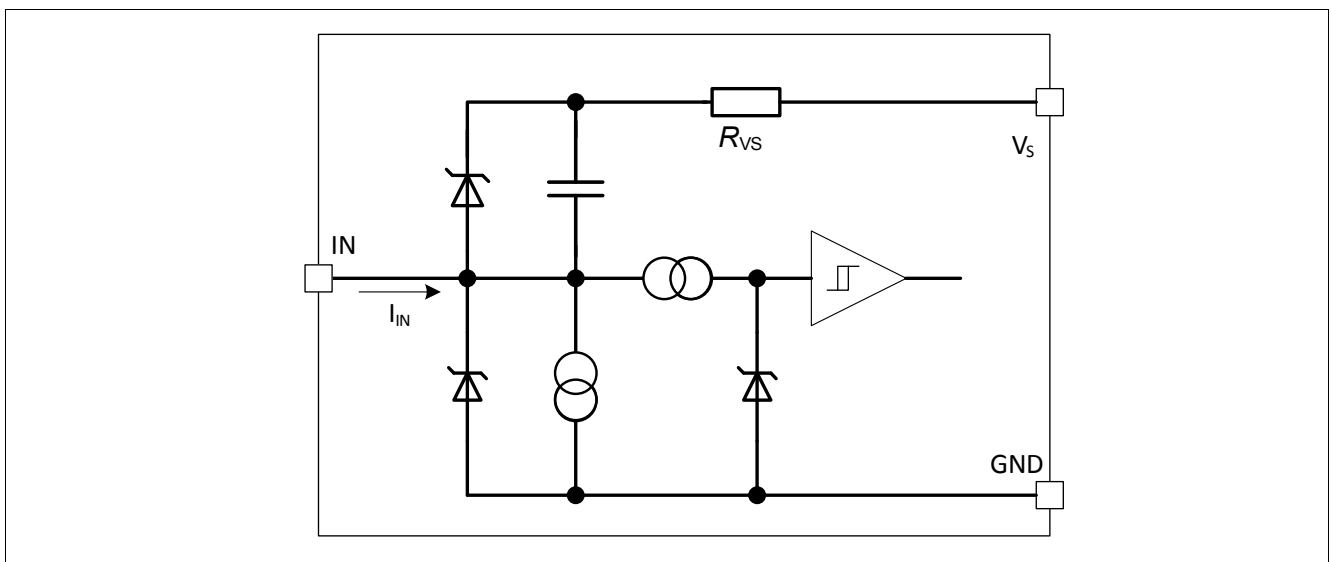

Figure 14 Input Pin Circuitry

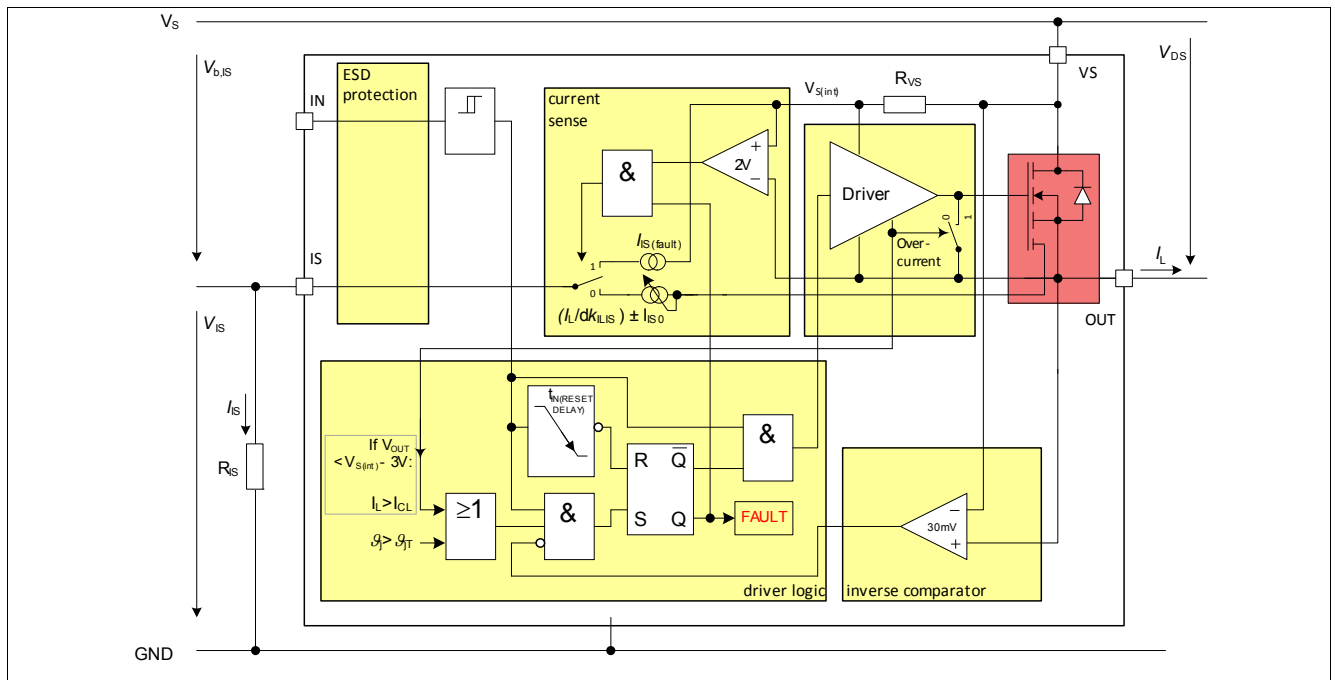

### 5.2.2 Input Pin Voltage

The IN uses a comparator with hysteresis. The switching ON / OFF takes place in a defined region, set by the threshold  $V_{IN(L)}$  Max and  $V_{IN(H)}$  Min. The exact value where ON and OFF take place depends on the process, as well as the temperature. To avoid cross talk and parasitic turn ON and OFF, a hysteresis is implemented. This ensures immunity to noise.

### 5.3 Protection Functions

The device provides embedded protective functions. Integrated protection functions are designed to prevent the destruction of the IC from fault conditions described in the datasheet. Fault conditions are considered as “outside” normal operating range. Protection functions are designed neither for continuous nor for repetitive operation.

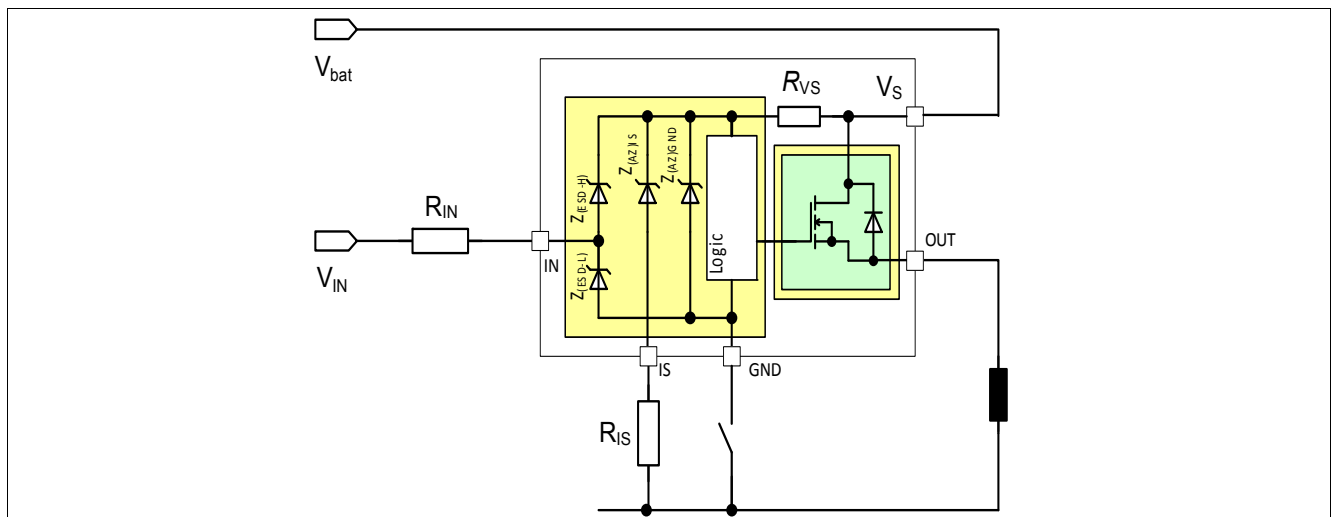

**Figure 15** describes the typical functionality of the diagnosis and protection block.

**Figure 15** Diagram of Diagnosis & Protection Block

#### 5.3.1 Loss of Ground Protection

In case of loss of module or device ground, where the load remains connected to ground, the device protects itself by automatically turning OFF (when it was previously ON) or remains OFF, regardless of the voltage applied on IN pin. It is recommended to use input resistors between the microcontroller and the BTS50045-1TAC to ensure switching OFF of the channel. In case of loss of module or device ground, a current ( $I_{OUT(GND)}$ ) can flow out of the DMOS. **Figure 16** sketches the situation.

**Figure 16** Loss of Ground Protection with External Components

### 5.3.2 Protection during Loss of Load or Loss of $V_S$ Condition

In case of loss of load with charged primary inductances the maximum supply voltage has to be limited. It is recommended to use a Z-diode, a varistor or  $V_S$  clamping power switches with connected loads in parallel. The voltage must be limited according to the minimum value of the parameter 6.1.33 indicated in [Table 6](#).

In case of loss of  $V_S$  connection with charged inductive loads, a current path with sufficient load current capability has to be provided, to demagnetize the charged inductances. It is recommended to protect the device using a zener diode together with a diode ( $V_{Z1} + V_{D1} < 16V$ ), as shown in [Figure 17](#).

For a proper restart of the device after loss of  $V_S$ , the input voltage must be applied delayed to the supply voltage. This can be realized by a capacitor between IN and GND (see [Figure 51](#)).

For higher clamp voltages, currents through all pins have to be limited according to the maximum ratings. Please see [Figure 17](#) and [Figure 18](#) for details.

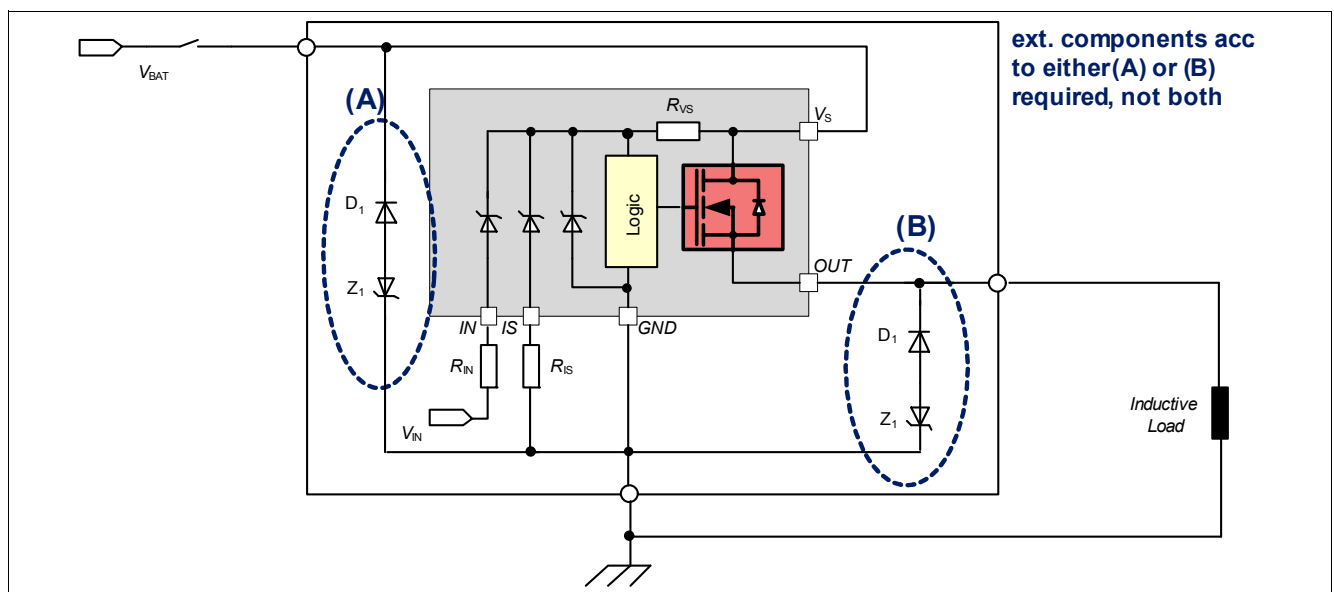

Figure 17 Loss of  $V_S$

Figure 18 Loss of Load

### 5.3.3 Undervoltage Behavior

If the supply voltage is in the area below  $V_{S(UV\_OFF)}$ , the device is OFF (turns OFF). As soon as the supply voltage is above  $V_{S(OP\_EXT)\_min}$ , the device will switch ON again. **Figure 19** sketches the undervoltage behavior.

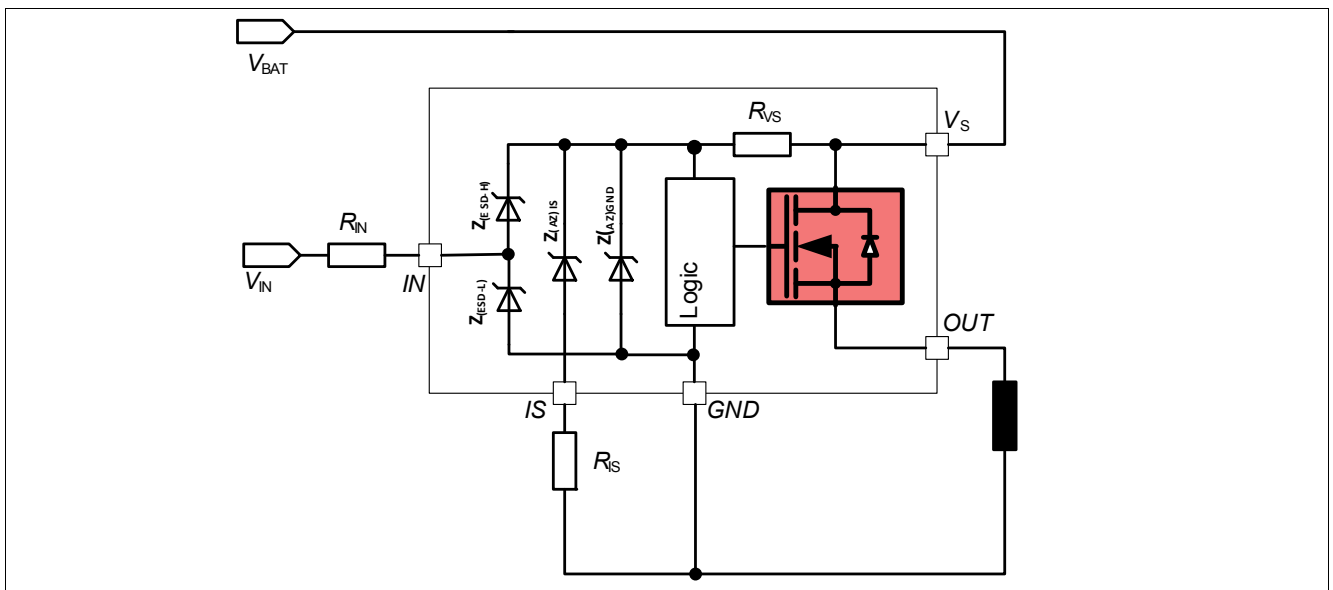

**Figure 19** Undervoltage Behavior

### 5.3.4 Overvoltage Protection

In the case  $V_{S(SC)\_max} < V_S < V_{DS(CL)}$ , the output transistor is still operational and follows the input. Parameters are no longer warranted and lifetime is reduced compared to normal mode. This specially impacts the short circuit robustness, as well as the maximum energy  $E_{AS}$  &  $E_{AR}$  the device can handle.

The BTS50045-1TAC provides Infineon® SMART CLAMPING functionality, which suppresses non nominal overvoltages by actively clamping the overvoltage across the power stage and the load. This is achieved by controlling the clamp voltage  $V_{DS(CL)}$  depending on the junction temperature  $T_J$  and the load current  $I_L$  (see **Figure 20** for details).

**Figure 20** Overvoltage Protection with External Components

### 5.3.5 Reverse Polarity Protection

In case of reverse polarity, the intrinsic body diode of the power DMOS causes power dissipation. To limit the risk of overtemperature, the device provides Infineon® Reversave function. The power in this intrinsic body diode is limited by turning the DMOS ON. The DMOS resistance is then equal to  $R_{DS(ON)_REV}$ .

Additionally, the current into the logic has to be limited. The device includes a  $R_{VS}$  resistor which limits the current in the diodes. To avoid overcurrent in the  $R_{VS}$  resistor, it is nevertheless recommended to use a  $R_{IN}$  resistor. Please refer to maximum current described in [Chapter 4.1](#). [Figure 21](#) shows a typical application.  $R_{SENSE}$  is used to limit the current in the sense transistor which behaves as a diode.

The recommended typical values for  $R_{IN}$  is 4.7kΩ and for  $R_{SENSE}$  1kΩ.

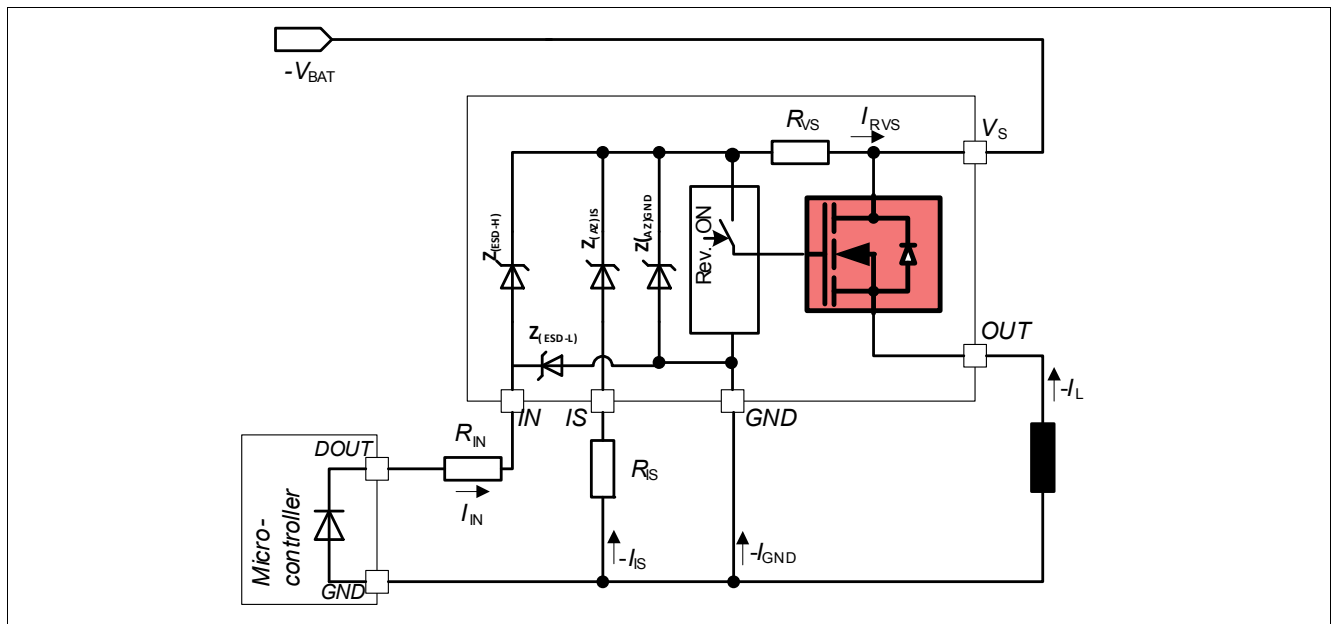

Figure 21 Reverse Polarity Protection with External Components

### 5.3.6 Overload Protection

In case of overload, high inrush current or short circuit to ground, the BTS50045-1TAC offers several protection mechanisms. Any protective switch OFF latches the output. To restart the device, it is necessary to set IN=LOW for  $t > t_{IN(RESETDELAY)}$ . This behavior is known as latch behavior. [Figure 22](#) gives a sketch of the situation.

#### 5.3.6.1 Activation of the Switch into Short Circuit (Short circuit Type 1)

When the switch is activated into short circuit, the current will raise until reaching the  $I_{L(TRIP)}$  value. After  $t_{OFF(TRIP)}$ , the device will turn OFF and latches until the IN pin is set to low for  $t > t_{IN(RESETDELAY)}$ . An undervoltage shutdown will not reset the latched fault overcurrent. For overload (short circuit or overtemperature), the maximum retry cycle ( $f_{fault}$ ) under fault condition must be considered.

#### 5.3.6.2 Short Circuit Appearance when the Device is already ON (Short circuit Type 2)

When the device is in ON state and a short circuit to ground appears at the output (SC2) with an overcurrent higher than  $I_{L(TRIP)}$  for a time longer than  $t_{OFF(TRIP)}$ , the device automatically turns OFF and latches until the IN pin is set to low for  $t > t_{IN(RESETDELAY)}$ . An undervoltage shutdown will not reset the latched fault overcurrent.

### 5.3.7 Temperature Limitation in the Power DMOS

The BTS50045-1TAC incorporates an absolute ( $T_{J(TRIP)}$ ) temperature sensor. Activation of the sensor will cause an overheated channel to switch OFF to prevent destruction. The device restarts when the IN pin is toggled and the temperature has decreased below  $T_{J(TRIP)} - \Delta T_{J(TRIP)}$ . An undervoltage shutdown will not reset the fault over temperature.

**Figure 22 Overload Protection**

The current sense exact signal timing can be found in the [Chapter 5.4](#). It is represented here only for device's behavior understanding.

## 5.4 Diagnostic Functions

For diagnosis purposes, the BTS50045-1TAC provides a combination of digital and analog signal at pin IS.

### 5.4.1 IS Pin

The BTS50045-1TAC provides an enhanced current sense signal called  $I_{IS}$  at pin IS. As long as no “hard” failure mode occurs (short circuit to GND / overcurrent / overtemperature) and the condition  $V_{IS} \leq V_{OUT} - 5V$  is fulfilled, a proportional signal to the load current (ratio  $k_{ILIS} = I_L / I_S$ ) is provided. The complete IS pin and diagnostic mechanism is described in [Figure 23](#). The accuracy of the sense current depends on temperature and load current. In case of failure, a fixed  $I_{IS(FAULT)}$  is provided. In order to enable the fault current reporting, the condition  $V_S - V_{OUT} > 2V$  must be fulfilled. In order to get the fault current in the specified range, the condition  $V_S - V_{IS} \geq 5V$  must be fulfilled.

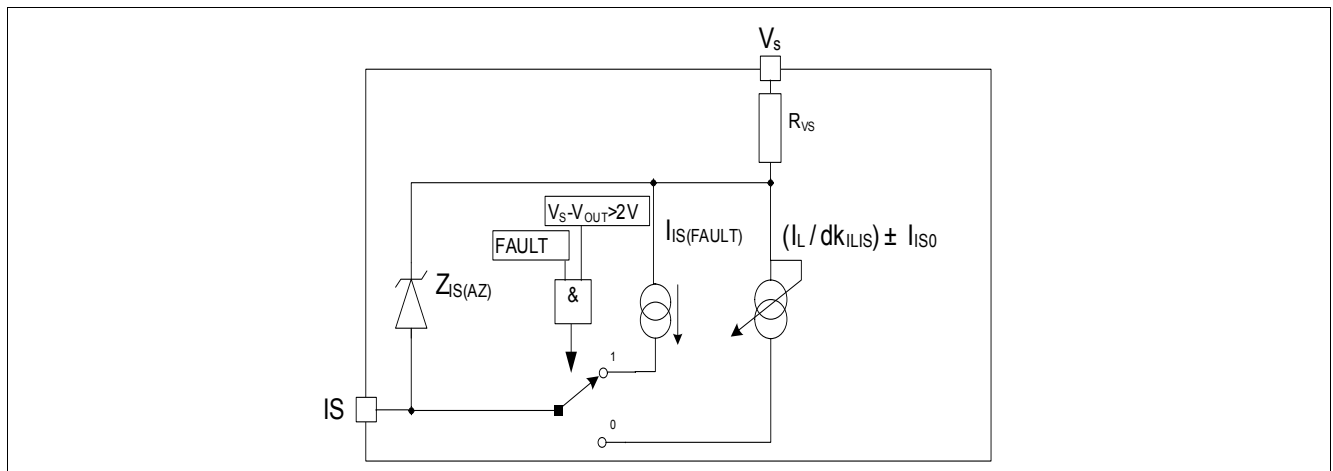

Figure 23 Diagnostic Block Diagram

### 5.4.2 SENSE Signal in Different Operation Mode

Table 5 Sense Signal, Function of Operation Mode<sup>1)</sup>

Operation mode	Input Level	Output Level $V_{OUT}$	Diagnostic Output (IS) <sup>2)</sup>
Normal operation	LOW (OFF)	~ GND	$I_{IS(OFF)}$
Short circuit to GND		GND	Z
Overtemperature		Z	Z
Short circuit to VS		$V_S$	Z
Open Load		Z	Z
Inverse current		$> V_S$	Z
Normal operation	HIGH (ON)	~ $V_S$	$I_{IS} = (I_L / dk_{ILIS}) \pm I_{IS0}$
Overcurrent condition		$< V_S$	$I_{IS} = (I_L / dk_{ILIS}) \pm I_{IS0} \dots I_{IS(FAULT)}$
Short circuit to GND		~ GND	$I_{IS(FAULT)}$
Overtemperature $T_{J(TRIP)}$ event		Z	$I_{IS(FAULT)}$
Short circuit to VS		$V_S$	$I_{IS} = 0 \dots I_L / dk_{ILIS} \pm I_{IS0}$
Open Load		~ $V_S$	$I_{IS0}$
Inverse current		$> V_S$	Z

1) Z = High Impedance

2) See [Chapter 5.4.3](#) for Current Sense Range and Improved Current Sense Accuracy

### 5.4.3 SENSE Signal in the Nominal Current Range

**Figure 24** and **Figure 25** show the current sense as function of the load current in the power DMOS. Usually, a pull-down resistor  $R_{IS}$  is connected to the current sense pin IS. A typical value is 1kΩ. The dotted curve represents the typical sense current, assuming a typical  $dk_{ILIS}$  factor value. The range between the two solid curves shows the sense accuracy the device is able to provide, at a defined current.

$$I_{IS} = \frac{I_L}{dk_{ILIS}} \pm I_{IS0} \quad \text{with}(I_{IS} \geq 0) \quad (3)$$

Where the definition of  $dk_{ILIS}$  is:

$$dk_{ILIS} = \frac{I_{L4} - I_{L1}}{I_{IS4} - I_{IS1}} \quad (4)$$

**Figure 24** Current Sense for Nominal and Overload Condition

#### 5.4.3.1 SENSE Signal Variation and calibration

In some application, an enhanced accuracy is required around the device nominal current range  $I_{L(NOM)}$ . To achieve this accuracy requirement, a calibration on the application is possible. After two points calibration, the BTS50045-1TAC will have a limited  $I_{IS}$  value spread at different load currents and temperature conditions. The  $I_{IS}$

## Functional Description

variation can be described with the parameters  $\Delta(dk_{ILIS(cal)})$  and the  $\alpha_{ISO}$ . The blue solid line in **Figure 25** is the current sense ratio after the two point calibration. The slope of this line is defined as follow:

$$\frac{1}{dk_{KILIS(cal)}} = \frac{I_{S(cal)2} - I_{S(cal)1}}{I_{L(cal)2} - I_{L(cal)1}} \quad (5)$$

The bluish in area in **Figure 25** is the range where the current sense ratio can vary after performing the calibration. The accuracy of the load current sensing is improved and, given a sense current value  $I_{IS}$  (measured in the application), the load current can be calculated as follow:

$$I_L = dk_{ILIS(cal)} \cdot \left(1 + \frac{\Delta(dk_{ILIS(cal)})}{100}\right) \cdot \left(I_{IS} - \frac{I_{ISO(cal)}}{1 + \alpha_{ISO}(T_x - T_{cal})}\right) \quad (6)$$

where  $dk_{ILIS(cal)}$  is the current sense ratio measured after two-points calibration (defined in **Equation (5)**),  $I_{ISO(cal)}$  is the current sense offset (calculated after two points calibration, see **Equation (7)**),  $T_x$  is the operating temperature, and  $T_{cal}$  is temperature at which the calibration is performed (25°C). The **Equation (6)** actually provides two values for load current, considering that  $\Delta(dk_{ILIS(cal)})$  can be both positive and negative (see parameter 6.1.47 in **Table 6**).

$$I_{ISO(cal)} = I_{S(cal)1} - \frac{I_{L(cal)1}}{dk_{ILIS(cal)}} = I_{S(cal)2} - \frac{I_{L(cal)2}}{dk_{ILIS(cal)}} \quad (7)$$

**Figure 25 Improved Current Sense Accuracy after 2-Point Calibration**

### 5.4.3.2 SENSE Signal Timing

Figure 26 shows the timing during settling and disabling of the sense.

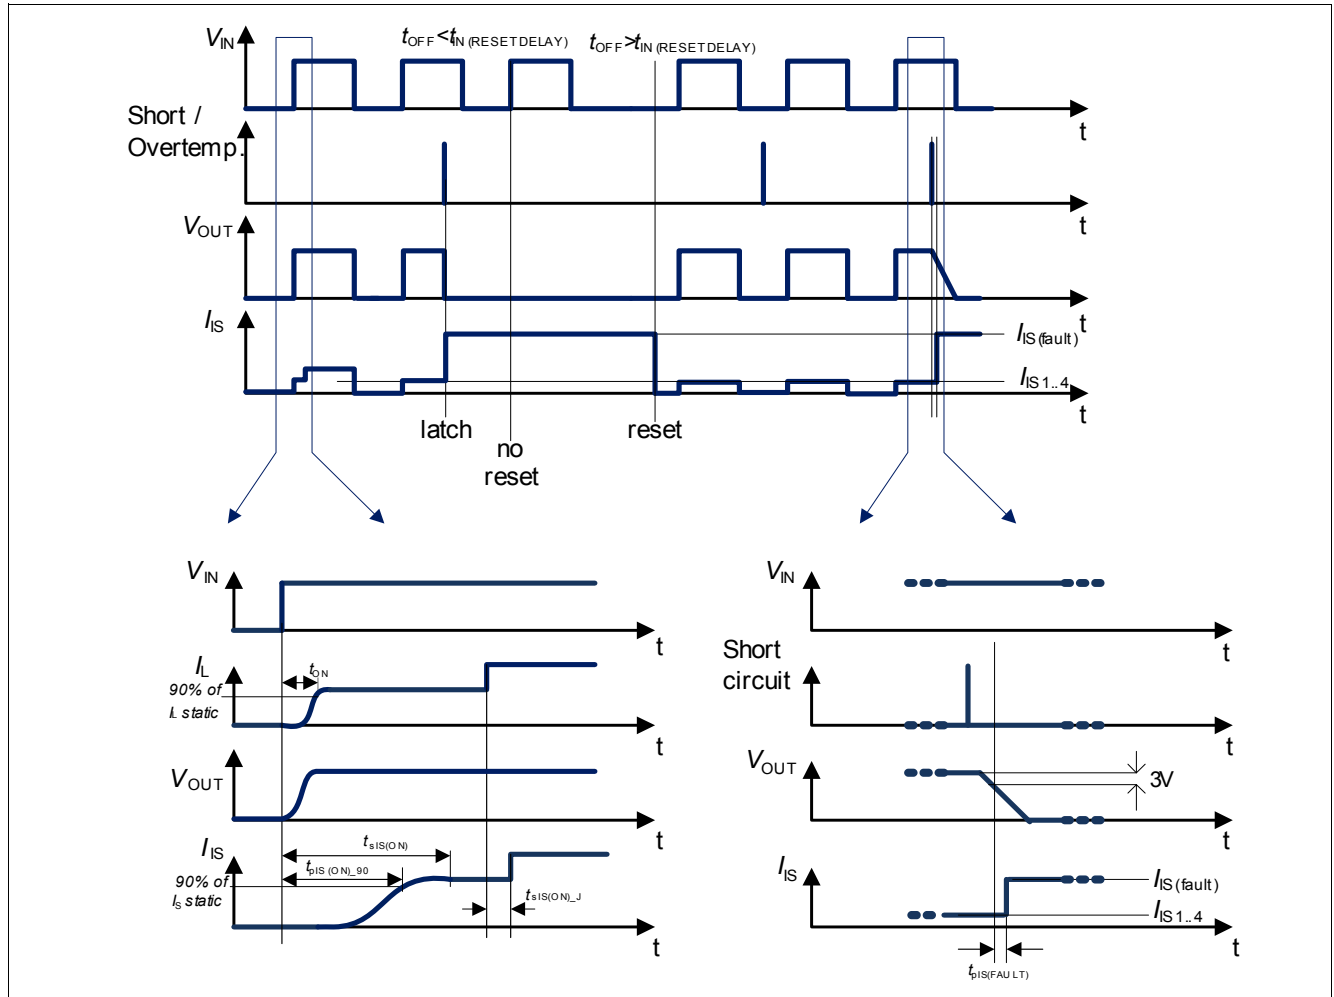

Figure 26 Fault Acknowledgement

### 5.4.3.3 SENSE Signal in Case of Short Circuit to $V_S$

In case of a short circuit between OUT and  $V_S$  pin, a major part of the load current will flow through the short circuit. As a result, a lower current compared to the nominal operation will flow through the DMOS of the BTS50045-1TAC, which can be recognized at the current sense signal.

### 5.4.3.4 SENSE Signal in Case of Over Load

An over load condition is defined by a current flowing out of the DMOS reaching the current over load  $I_{CL}$  or the junction temperature reaches the thermal shutdown temperature  $T_{J(TRIP)}$ . Please refer to [Chapter 5.3.6](#) for details. In that case, the SENSE signal will be in the range of  $I_{IS(FAULT)}$  when the IN pin stays HIGH.

This is a device with latch function. The state of the device will remain and the sense signal will remain on  $I_{IS(FAULT)}$  until a reset signal comes from the IN pin. For example, when a thermal shutdown happened, even the over temperature condition was disappeared, the DMOS can only be reactivated when a reset signal is send to the IN pin.

## 6 Electrical characteristics BTS50045-1TAC

### 6.1 Electrical Characteristics Table

**Table 6 Electrical Characteristics: BTS50045-1TAC**

$V_S = 8\text{ V to }18\text{ V}$ ,  $T_J = -40^\circ\text{C to }+150^\circ\text{C}$  (unless otherwise specified)

For a given temperature or voltage range, typical values are specified at  $V_S = 13.5\text{V}$ ,  $T_J = 25^\circ\text{C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Operating and Standby Currents							
Operating current (channel active)	$I_{\text{GND}}$	—	1.2	3	mA	$V_{\text{IN}} \geq 2.2\text{V}$	6.1.1
Standby current for whole device with load at ambient	$I_{\text{S(OFF)}}$	—	7	18	μA	<sup>1)</sup> $V_{\text{S}} = 18\text{V}$ $V_{\text{OUT}} = 0\text{V}$ $V_{\text{IN}} \leq 0.8\text{V}$ $T_{\text{J}} \leq 85^{\circ}\text{C}$ See <a href="#">Figure 27</a> See <a href="#">Figure 28</a>	6.1.2
Maximum standby current for whole device with load at max junction	$I_{\text{S(OFF)}}$	—	20	500	μA	$V_{\text{S}} = 18\text{V}$ $V_{\text{OUT}} = 0\text{V}$ $V_{\text{IN}} \leq 0.8\text{V}$ $T_{\text{J}} \leq 150^{\circ}\text{C}$ See <a href="#">Figure 27</a> See <a href="#">Figure 28</a>	6.1.3
Power Stage							
ON state resistance in forward condition	$R_{\text{DS(ON)}}$	—	6.5	9	mΩ	$I_{\text{L}} = 70\text{A}$ $V_{\text{IN}} \geq 2.2\text{V}$ $T_{\text{J}} = 150^{\circ}\text{C}$ See <a href="#">Figure 31</a>	6.1.4

**Figure 43** Output Leakage Current while Device GND Disconnected,  $I_{OUT(GND)} = f(V_S, T_J)$

**Figure 44** Overload Detection Current  $I_{CL(1)} = f(dI_L/dt, T_J), V_S = 13.5V$

**Figure 45** Resistance in Reversave  $R_{DS(ON)_REV} = f(V_S, T_J), I_L = -70A$

**Figure 46** Resistance in Reversave  $R_{DS(ON)_REV} = f(V_S, T_J), I_L = -10A$

**Figure 47** Input Current  $I_{IN} = f(T_J)$   
 $V_S = 13.5V$ ;  $V_{IN(L)} = 0.8V$ ;  $V_{IN(H)} = 5.0V$

**Figure 48** Input Current  $I_{IN} = f(V_{IN}, T_J)$   
 $V_S = 13.5V$

**Figure 49** GND current  $I_{GND} = f(V_S, T_J)$   
 $V_{IN} = 2.2V$

## 7 Package Outlines

**Figure 50 PG-TO-263-7-8 (RoHS-Compliant)**

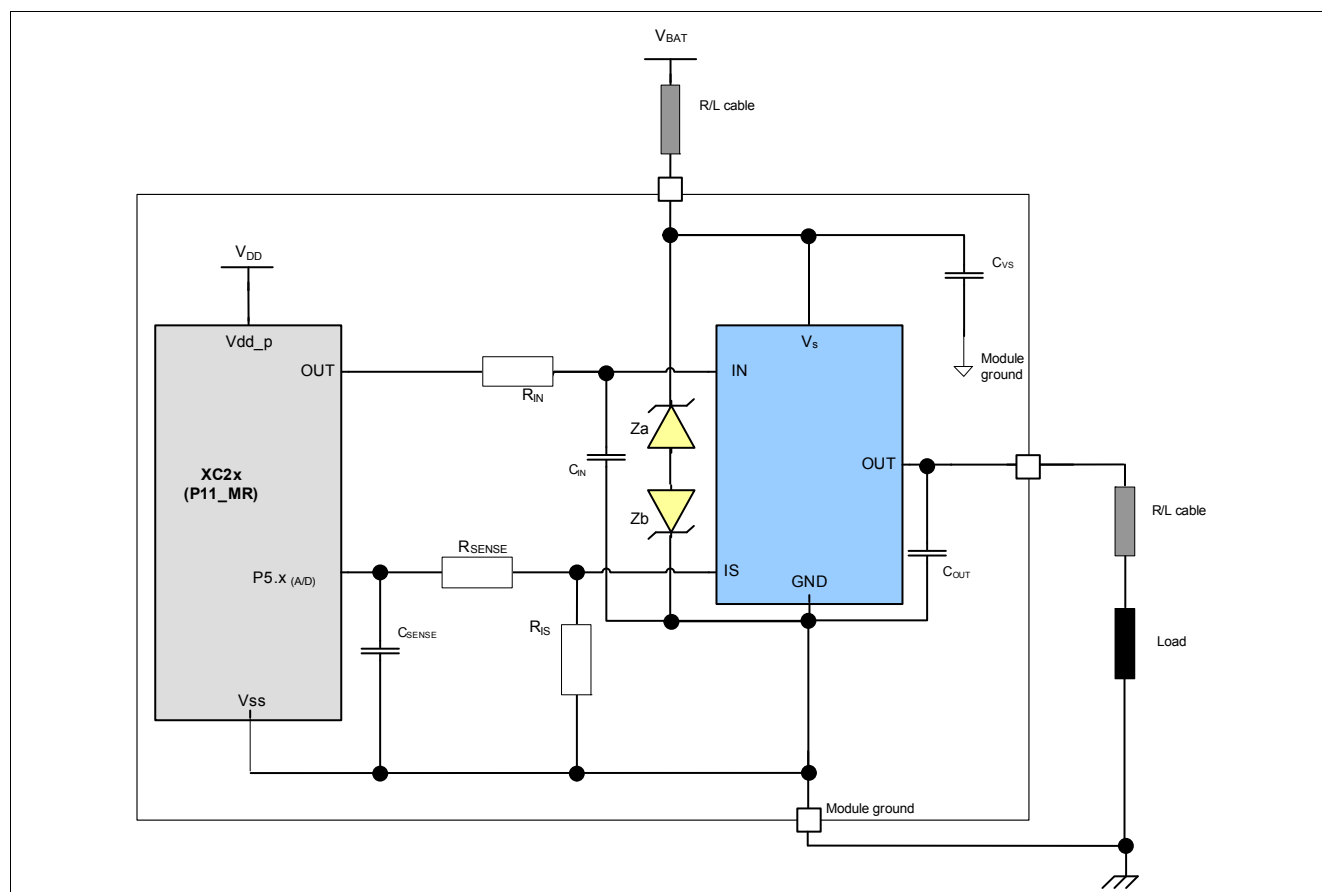

### Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

For further information on alternative packages, please visit our website:  
<http://www.infineon.com/packages>.

## 8 Application Information

*Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.*

**Figure 51 Application Diagram with BTS50045-1TAC**

*Note: This is a very simplified example of an application circuit. The function must be verified in the real application.*

**Table 7 Bill of material**

Reference	Value	Purpose
$R_{IN}$	4.7k $\Omega$	Protection of the microcontroller during overvoltage, reverse polarity allows BTS50045-1TAC channels OFF during loss of ground
$R_{IS}$	1k $\Omega$	Sense resistor
$R_{SENSE}$	4.7k $\Omega$	Protection of the microcontroller during overvoltage Protection of the BTS50045-1TAC during reverse polarity
$Z_a$	Zener diode	Protection of the BTS50045-1TAC during loss of load with primary charged inductance, see <a href="#">Chapter 5.3.2</a>
$Z_b$	Zener diode	Protection of the BTS50045-1TAC during loss of battery or against huge negative pulse at OUT (like ISO pulse 1), see <a href="#">Chapter 5.3.2</a>
$C_{SENSE}$	10nF	Sense signal filtering
$C_{VS}$	100nF	Improved EMC behavior (in layout, pls. place close to the pins)

**Table 7 Bill of material**

Reference	Value	Purpose
$C_{OUT}$	10nF	Improved EMC behavior (in layout, pls. place close to the pins)
$C_{IN}$	220nF	BTS50045-1TAC tends to latched switch-off due to short negative transients on supply pin; $C_{IN}$ automatically resets the device

## 8.1 Further Application Information

- Please contact us for information regarding the pin FMEA
- For further information you may contact <http://www.infineon.com/>

## 9 Revision History

Revision	Date	Changes
1.0	2014-01-31	Datasheet release

### **Legal Disclaimer**

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
