

Solid State Relay for Automotive Flasher Applications

This device is a Dual High-Side Power Switch dedicated for automotive flasher applications. In comparison with mechanical solutions, this device offers higher reliability as well as protection and diagnostic features.

The device consists of two 25 mΩ R_{DS(ON)} fully protected high side switches, in a surface mount power package. It interfaces directly with a microcontroller and includes a current recopy function in order to allow the detection of a failed lamp in the application.

Features

- Junction Temperature Range from -40°C to 150°C
- Operating Voltage Range from 8.0 V to 35 V
- Maximum Breakdown Voltage greater than 40 V
- 25 mΩ R_{DS(ON)} per Channel at 25°C
- 8.0 Amps Nominal Current per Channel
- 1.2 W Warning Lamp Driver
- Overtemperature Protection with Hysteresis
- Open Load Detection in ON State
- Current Recopy to Monitor Lamp Output Current

- Standby Current < 10 μA at V_{BAT} < 14 V

TERMINAL CONNECTIONS

Figure 2. 33288 Terminal Connections

Table 1. 33288 Terminal Definitions

A functional description of each terminal can be found in the Functional Description section beginning on [7](#).

Terminal Number	Terminal Name	Formal Name	Definition
TAB	V _{BAT}	Supply Voltage	The backside TAB is connected to the power supply of the MC33288DH.
2	CUR R	Load Current Sense	The Current Sense terminal delivers a ratioed amount (1/1000) of the sum of the currents that can be used to generate signal ground referenced output voltages for use by the microcontroller.
3	IN1	INPUT Channel 1	These are the device input terminals which directly control their associated outputs.
18	IN2	INPUT Channel 2	
4, 9, 10, 11, 12, 17	NC	No Connect	These terminals are not used.
5, 16	DNC	Do Not Connect	These terminals must not be connected.
6, 7, 8	OUT1	OUTPUT Channel 1	They deliver current to the connected loads and are controlled via the IN1 terminals.
13, 14, 15	OUT2	OUTPUT Channel 2	They deliver current to the connected loads and are controlled via the IN2 terminals,
11	GND	Ground	This is the ground terminal of the device.
19	STATUS	Status for Both Channels	The Fault output is an open drain indication that goes active low when a fault mode (Openload, Overtemperature) is detected by the device.
20	WLP	Warning Lamp Output	It delivers current through the connected load.

MAXIMUM RATINGS

Table 2. Maximum Ratings

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Ratings	Symbol	Value	Unit
ELECTRICAL RATINGS			
V _{BAT} Voltage with Respect to GND : Continuous/Pulse	V _{BAT}	-14 to 40	V
OUT1 and OUT2 Voltage with Respect to GND : Continuous/Pulse	V _{OUT}	-0.3 to 40	V
OUT1 to V _{BAT} and OUT2 to V _{BAT} Voltage : Continuous/Pulse	V _{OUT}	40	V
IN1, IN2, St DC Voltage : Continuous/Pulse	V _{IN}	-0.3 to 7.0	V
CUR R Voltage : Continuous/Pulse	V _{CR}	-0.3 to 7.0	V
ESD All Pins			V
Human Body Model ⁽¹⁾	V _{ESD1}	±2000	
Machine Model ⁽²⁾	V _{ESD2}	±200	
OUT1, OUT2 Output Current : Pulse ⁽³⁾	I _{OUTP}	40	A
IN1, IN2, STATUS	I _{IN}	±5.0	mA
THERMAL RATINGS			
Junction Temperature	T _J	-40 to 150	°C
Storage Temperature Range	T _{STORAGE}	-65 to 150	°C
Thermal Resistance Junction to Case	R _{θJC}	2.0	°C/W
Thermal Resistance Junction to Ambient ⁽⁴⁾	R _{θJA}	25	°C/W
Power Dissipation at Tcase 140°C ⁽⁵⁾	P _D	5.0	W

Notes

- ESD1 testing is performed in accordance with the Human Body Model (C_{ZAP}=100 pF, R_{ZAP}=1500 Ω).
- ESD2 testing is performed in accordance with the Machine Model (C_{ZAP}=200 pF, R_{ZAP}=0 Ω).
- During lamp inrush current.
- Device mounted on dual side printed circuit board with 70 μm copper thickness and 10 cm² copper heat sink (2.5 cm² on top side and 7.5 cm² on down side).
- Assuming a 150°C maximum junction temperature.

STATIC ELECTRICAL CHARACTERISTICS

Table 3. Static Electrical Characteristics

Characteristics noted under conditions $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $9.0\text{ V} \leq V_{PWR} \leq 16\text{ V}$, $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$, unless otherwise noted. Typical values noted reflect the approximate parameter mean at $T_A = 25^\circ\text{C}$ under nominal conditions, unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit
POWER INPUT					
Nominal Operating Voltage	V_{BAT}	9	–	16	V
Functional Operating Voltage	V_{BAT}	8	–	35	V
Under Voltage Threshold	$V_{\mu V}$	6	7	8	V
V_{BAT} Standby Supply Current $V_{BAT} < 14\text{ V}$ and $V_{IN} = 0\text{ V}$, $T_J < 125^\circ\text{C}$	I_{STDBY}	–	1	10	μA
Supply Current in ON State IN1 and IN2 @ 3.5 V, no fault, $V_{BAT} < 14\text{ V}$, $T_J < 125^\circ\text{C}$	I_{ON}	–	8	20	mA
Drain to Source on Resistance $I_{OUT} = 4.0\text{ A}$, $V_{BAT} > 9.0\text{ V}$ and $T_J = 25^\circ\text{C}$	R_{DSON}	–	20	25	$\text{m}\Omega$
Drain to Source on Resistance $I_{OUT} = 4.0\text{ A}$, $V_{BAT} > 9.0\text{ V}$ and $T_J = 150^\circ\text{C}$	R_{DSON}	–	30	40	$\text{m}\Omega$
High Current Limitation $V_{OUT} > 1.0\text{ V}$	I_{LIM}	–	30	–	A
Short Circuit limitation $V_{OUT} < 1.0\text{ V}$, $T_J = 25^\circ\text{C}$	I_{LIM}	–	4	–	A
Hot Openload Threshold	I_{OL}	–	1	–	A
V_{BAT} to Output Breakdown Voltage IN1 and IN2 @ 0 V, $V_{OUT} = 0\text{ V}$, $I_{OUT} -0.25\text{ mA}$	V_{DSS}	40	–	–	A
V_{BAT} to OUT1 : Leakage Current $V_{IN1} = 0\text{ V}$, $V_{BAT} = 35\text{ V}$, $V_{OUT1} = 0\text{ V}$	$I_{OUT-LEAK}$	–	–	10	μA
V_{BAT} to OUT2 : Leakage Current $V_{IN2} = 0\text{ V}$, $V_{BAT} = 35\text{ V}$, $V_{OUT2} = 0\text{ V}$	$I_{OUT-LEAK}$	–	–	10	μA
VIN1, VIN2 : Input Voltage Low Threshold	V_{IL}	–	–	1.5	V
VIN1, VIN2 : Input Voltage High Threshold	V_{IH}	3.5	–	–	V
VIN1, VIN2 : Input Voltage Hysteresis	V_{IH}	0.4	0.7	0.9	V
VIN1, VIN2 : Input Current V_{IN1} , $V_{IN2} = 3.5\text{ V}$	I_{IN}	–	18	40	μA
Status Output Voltage $I_{st} = 1\text{ mA}$; Output in Fault	V_{st}	–	–	0.5	V
Thermal Shutdown	T_{SHUT}	150	–	–	$^\circ\text{C}$
Thermal Shutdown Hysteresis	T_{HYST}	–	10	–	$^\circ\text{C}$

Table 3. Static Electrical Characteristics(continued)

Characteristics noted under conditions $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $9.0\text{ V} \leq V_{PWR} \leq 16\text{ V}$, $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$, unless otherwise noted. Typical values noted reflect the approximate parameter mean at $T_A = 25^\circ\text{C}$ under nominal conditions, unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit
Current Recopy Ratio $V_{OUT} > V_{BAT} - 1.0\text{ V}$, I_{OUT} from 2.0 A to 4.0 A T_J -40°C to 105°C , V_{BAT} 9.0 V to 16 V	C_R	–	1/1000	–	μA
Current Recopy Ratio Accuracy $V_{OUT} > V_{BAT} - 1.0\text{ V}$, I_{OUT} from 2.0 A to 4.0 A T_J -40°C to 105°C , V_{BAT} 9.0 V to 16 V	C_{R-AC}	-10	–	10	%
Extended Current Recopy Ratio $V_{OUT} > V_{BAT} - 1.0\text{ V}$, I_{OUT} from 1.0 A to 8.0 A	C_{REX}	–	1/1000	–	%
Extended Current Recopy Ratio Accuracy $V_{OUT} > V_{BAT} - 1.0\text{ V}$, I_{OUT} from 1.0 A to 8.0 A	C_{REX-AC}	-20	–	20	%
Current Recopy Clamp Voltage At 10mA	V_{CLST}	5.5	–	7.0	V
Nominal Flasher Frequency Operation	F_{FL}	–	1.5	–	Hz
Frequency Operation	F_{OP}	–	–	100	Hz
Nominal Flasher Duty Cycle Operation	D_{CFL}	–	50	–	%
WLP Output Drain to Source on Resistance $I_{OUT} = 100\text{ mA}$, $V_{BAT} > 9.0\text{ V}$ and $T_J = 25^\circ\text{C}$	R_{WON}	–	–	3.2	Ω
WLP Output Drain to Source on Resistance $I_{OUT} = 100\text{ mA}$, $V_{BAT} > 9.0\text{ V}$ and $T_J = 125^\circ\text{C}$	R_{WON}	–	–	5.0	Ω
WLP Output Current Limitation $V_{OUT} = 0\text{ V}$	I_{WLIM}	–	500	–	mA
WLP Thermal Shutdown	T_{WSHUT}	150	–	–	$^\circ\text{C}$

DYNAMIC ELECTRICAL CHARACTERISTICS

Table 4. Dynamic Electrical Characteristics

Characteristics noted under conditions $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $9.0\text{ V} \leq V_{PWR} \leq 16\text{ V}$, $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$, unless otherwise noted. Typical values noted reflect the approximate parameter mean at $T_A = 25^\circ\text{C}$ under nominal conditions, unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit
MICROCONTROLLER INTERFACE					
Maximum Output Positive Slew Rate Load = $6.0\ \Omega$	t_R	0.01	0.3	2.0	$\text{V}/\mu\text{s}$
Maximum Output Negative Slew Rate Load = $6.0\ \Omega$	t_F	0.01	0.3	2.0	$\text{V}/\mu\text{s}$
Turn ON Delay Time Load = $6.0\ \Omega$, from $V_{IN/2}$ to $10\% V_{OUT}$	T_{DON}	1.0	30	200	μs
Turn OFF Delay Time Load = $6.0\ \Omega$, from $V_{IN/2}$ to $90\% V_{OUT}$	T_{DOFF}	1.0	40	200	μs

FUNCTIONAL DESCRIPTION

INTRODUCTION

The MC33288DH is a dual high side switch with appropriate control, protection, and diagnostic features dedicated to automotive flasher applications. The device consists of two independent 25mW power switches and an additional 3.2 Ω high-side switch capable of controlling a 1.2

W warning lamp. It interfaces directly with a microcontroller and the package used is a 20-HSOP power small outline, 20 terminals. The MC33288 incorporates a status terminal and a load current sense capability.

FUNCTIONAL TERMINAL DESCRIPTIONS

SUPPLY VOLTAGE (VBAT)

The backside TAB is connected to the power supply of the MC33288DH. In addition to its supply function, this terminal contributes to the thermal behaviour of the device by conducting the heat from the switching MOSFET to the printed circuit board.

LOAD CURRENT SENSE (CURRENT)

The Current Sense terminal delivers a ratioed amount (1/1000) of the sum of the currents that can be used to generate signal ground referenced output voltages for use by the microcontroller.

INPUT CHANNEL 1/2 (IN1, IN2)

These are the device input terminals which directly control their associated outputs. The levels are CMOS compatible. When the input is a logic low, the associated output MOSFET is in the OFF state. When input is high, the MOSFET is turned ON and the load is activated. When both inputs are low, the device is in standby mode and its supply current is reduced. Each input terminal has an internal active pull-down, so that it will not float if disconnected.

OUTPUT CHANNEL (OUT1, OUT2)

Pins 6, 7, and 8 are the source of the output 1 25 m Ω MOSFET1. Pins 13, 14, and 15 are the source of the output 2 25 m Ω MOSFET2. They deliver current to the connected loads and are controlled via the IN1 and IN2 terminals, respectively. These outputs are current limited and thermally protected.

GROUND (GND)

This is the ground terminal of the device.

STATUS FOR BOTH CHANNELS (STATUS)

The Fault output is an open drain indication that goes active low when a fault mode (Openload, Overtemperature) is detected by the device on either one channel or both channels simultaneously. Its internal structure is an open drain architecture with an internal clamp at 6.0 V. An external pull-up resistor connected to V_{DD} (5.0 V) is needed.

WARNING LAMP OUTPUT (WLP)

This terminal is the source of a 3.2 Ω MOSFET. This output is current limited and thermally protected. It delivers current through the connected load when both IN1 and IN2 inputs are logic high. It is usually used as a warning lamp driver for Flasher application.

FUNCTIONAL DEVICE OPERATION

OPERATIONAL MODES

Power Supply

The MC33288 can be directly connected to the supply line. In standby mode (IN1 and IN2 @ OV), the supply current is less than 10 mA for V_{BAT} supply voltage below 14 V. This feature allows a very low supply current on the battery when the car is idle or parked.

During the OFF state, the current recopy terminal and the status terminals are in high impedance.

In case of loss of (digital) ground, the power MOSFETs turn off in order to safely tie the load current to zero.

Nominal Voltage and Transient Operation

The nominal operation voltage is from 9.0 V to 16 V. The MC33288 is functional over a larger voltage range from 8.0 V to 35 V. The technology used for both power and analog circuitry sustains 40 V DC voltage.

Reverse Battery

The MC33288 is self protected against reverse battery up to -14 V in a continuous mode. When a negative battery voltage arises, the MOSFETs are internally turned off. The load current flows in the body diode of each MOSFET. The power dissipation within the MC33288DH is then $V_F \times I_{LOAD}$, where I_{LOAD} is the total current set by the loads and V_F is the forward body diode voltage. V_F is 0.5 V typical at 150°C and decreases with temperature with a drop of -2.0 mV/°C.

Power Output Switches

The device has two independent high-side switches. Each switch is realized with an N-channel power MOSFET and includes current and temperature sensing circuitries. The MOSFET gates are driven by analog circuitry which includes charge pump and fault detection. A specific feature of this device is the output current recopy.

Each output has a 25 mΩ $R_{DS(ON)}$ maximum at 25°C. The $R_{DS(ON)}$ value reaches 40 mΩ at 150°C junction temperature. Each output has a parasitic drain to source diode, inherent to the technology. This diode can sustain as much current as the MOSFET. This diode is reversed biased during normal operation of the MOSFET and is forward biased during reverse battery or negative transient pulses.

The output MOSFET can each drive 8.0 A nominal. This maximum current condition occurs when up to three 21 W lamps and two small 5.0 W or 7.0 W lamps are connected on each channel, at higher V_{BAT} voltage specification. This is the case when a trailer is attached to the car. As the flasher can operate in warning or hazard operation mode with its two channels on, the MC33288 can drive 16 A total.

When lamps are turned on, the inrush current can reach up to 6 times the nominal lamp current. For this particular application, the total inrush current can reach 6 x 8.0 A—that

is up to 48 A per channel. The 48 A value will only occur at the first lamp turn-on. In order to optimise the total system (MC33288, printed circuit board, wiring, fuse etc.), the device incorporates a current limitation at 30 A typical. This means that the first inrush current will be clamped at 30 A. The second lamp turn-on of the flashing cycle will not see any clamping as the lamps have been heated up in the previous cycle.

IN1 and IN2 are the two inputs of the device, connected to a microcontroller I/O; they are CMOS compatible. When these inputs are in low state, the device is in standby mode. When any of the inputs are switched to a high level, the associated output MOSFET is turned on.

Status

The device has a single status terminal which reports an overtemperature and an openload condition in the device. This terminal is an open drain structure and needs an external pull-up resistor. The device incorporates overtemperature sense on each output MOSFET in order to independently protect each output. But, the report of the overtemperature is done through one single status terminal, called STATUS, in order to minimize the number of I/O connections of the MCU.

Open Load Function

The open load detection is active during the ON phase (hot openload detection). An amplifier measures the differential voltage between V_{BAT} and V_{OUT} .

When the load current is below 1.0 A, the openload circuitry will pull down the status output. If the openload condition is present before the device turn-on, the status will be pulled down after a delay due to the rise time of the output.

Current Recopy Function

Flasher application needs to detect failed lamp. The system must detect one 21 W lamp failing, in the flasher application only, without a trailer. The MC33288 has an output current recopy function which recopies on the CUR R terminal a portion of the output current. Each channel is connected to the same CUR R terminal as the system has to operate in the flasher mode only and not in the warning operation.

The MC33288 provides a current recopy of 1/1000 of the main output current, either output left or right. The recopy function has its higher accuracy of ±10% in the usual operation range and an accuracy of ±20% in the total operating range. This allows a precise detection of one 21 W lamp, but also the detection of additional lamps in case of trailer connection.

This paragraph is boilerplate - you may add to it but, can not change wording. You may change numeric values

An external resistor must be connected to the CUR R terminal and then tied to a microcontroller A/D input for analog voltage measurement. The CUR R terminal is internally clamped to protect the MCU A/D input.

Warning Lamp Driver

The warning lamp driver is a 3.2Ω $R_{\text{DS(on)}}$ maximum high-side MOSFET to control the 1.2 W dashboard warning lamp. This output is current limited and thermally protected-activated only in the warning mode. It is turned on by activation of both right and left inputs (IN1 and IN2).

Package

The device is assembled into a power surface mount package. This package offers high thermal performances and high current capabilities. It offers 10 terminals on each package sides and an additional terminal which is the package heat sink, called terminal 21. The heat sink acts as the MC33288 power V_{BAT} connection.

Soldering Information

This device is packaged in a Surface Mount Power package intended to be soldered directly on the Printed Circuit Board.

This device was qualified according to JEDEC standards JESD22-A113-B and J-STD-020A with the reflow conditions applicable for packages with thickness above 2.5 mm:

Convection $220^{\circ}\text{C} +5/-0^{\circ}\text{C}$

VPR 215-219 $^{\circ}\text{C}$

IR / Convection $220^{\circ}\text{C} +5/-0^{\circ}\text{C}$

The maximum peak temperature during the soldering process should not exceed $220^{\circ}\text{C} (+5^{\circ}\text{C}/-0^{\circ}\text{C})$. The time at maximum temperature should range from 10 to 40s maximum.

Thermal Management

The junction to case thermal resistance is $2^{\circ}\text{C}/\text{W}$ maximum. The junction to ambient thermal resistance is dependent on the mounting technology and the addition of heat sink. One of the most commonly used mounting techniques consists of using the printed circuit board and the copper lines as heat sink.

Figure 3. Printed Board Layout Example (not to scale)

Figure 1 shows an example of printed circuit board layout. It has a total of 10 cm^2 additional copper on two sides (2.5 cm^2 on the top side and 7.5 cm^2 on the down side).

With the above layout, thermal resistance junction to ambient of $25^{\circ}\text{C}/\text{W}$ can be achieved, this value being split into:

- junction to case : $R_{\theta\text{JC}1} = R_{\theta\text{JC}2} = 2^{\circ}\text{C}/\text{W}$
- case to ambient : $R_{\theta\text{CA}} = 23^{\circ}\text{C}/\text{W}$

Lower value can be reached with the help of larger and thicker copper metal, higher number of thermal via from top to down side pcb and the use of additional thermal via from the circuit board to the module case.

Steady State Thermal Model

The junction to ambient thermal resistance of the circuit mounted on a printed circuit board can be split into two main parts: junction to case and case to ambient resistances.

A simplified steady state thermal model is shown in Figure 2.

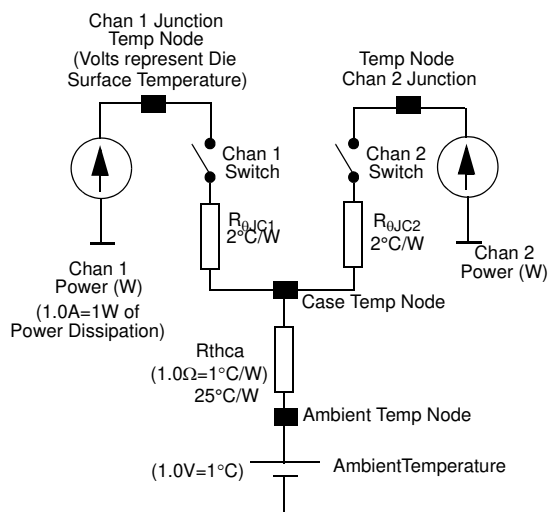

Figure 4. Simplified Thermal Model (Electrical Equivalent)

Transient Thermal Model

A more complete model including thermal capacitance is proposed in Figure 3.

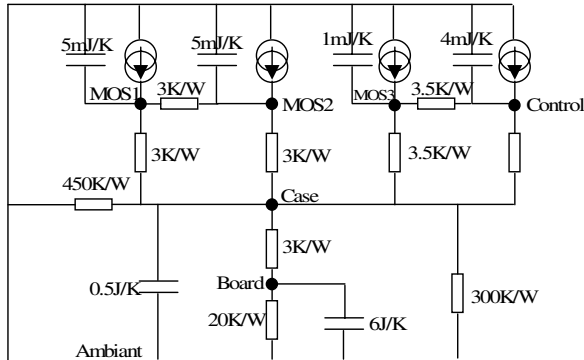

Figure 5. Transient Thermal Model

This gives a thermal impedance versus time (Figure 4), which has been determined with the printed circuit board shown in Figure 1.

Figure 6. Junction to Ambient Thermal Impedance

This figure shows that the steady state is reached after about 10 minutes. It also clearly shows that the device can dissipate almost twice the power within one minute compared to the maximum allowed power dissipation in steady state.

TYPICAL APPLICATIONS
