Functional Description

CY62168GN30 is high-performance CMOS low-power (MoBL) SRAM devices. Both devices are offered in single and dual chip enable options and in multiple pin configurations.

Devices with a single chip enable input are accessed by asserting the chip enable input (CE) LOW. Dual chip enable

devices are accessed by asserting both chip enable inputs – \overline{CE}_1 as LOW and CE_2 as HIGH.

Write to the device by taking Chip Enable 1 (\overline{CE}_1) LOW and Chip Enable 2 (CE_2) HIGH and the Write Enable (WE) input LOW. Data on the eight I/O pins (I/O₀ through I/O₇) is then written into the location specified on the address pins (A₀ through A₂₀).

Read from the device by taking Chip Enable 1 (\overline{CE}_1) and Output Enable (\overline{OE}) LOW and Chip Enable 2 (CE_2) HIGH while forcing Write Enable (WE) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input and output pins (I/O₀ through I/O₇) are placed in a high impedance state when the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW), the outputs are disabled (\overline{OE} HIGH), or a write operation is in progress (\overline{CE}_1 LOW and CE_2 HIGH and WE LOW). See the [Truth Table – CY62168GN30 on page 12](#) for a complete description of read and write modes.

The CY62168GN30 device is available in a Pb-free 48-pin VFBGA package. The logic block diagrams are on page 2.

Notes

22. Test conditions assume signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for $V_{CC} \geq 3$ V) and $V_{CC}/2$ (for $V_{CC} < 3$ V), and input pulse levels of 0 to 3 V (for $V_{CC} \geq 3$ V) and 0 to V_{CC} (for $V_{CC} < 3$ V). Test conditions for the read cycle use output loading shown in AC Test Loads and Waveforms section, unless specified otherwise.

23. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.

24. Tested initially and after any design or process changes that may affect these parameters.

25. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.

26. These parameters are guaranteed by design and are not tested.

27. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

28. The minimum write cycle pulse width for write cycle No. 2 (\overline{WE} Controlled, \overline{OE} Low) should be equal to the sum of t_{HZWE} and t_{SD} .

Notes

- 29. The device is continuously selected. $\overline{OE} = V_{IL}$, $\overline{CE} = V_{IL}$.
- 30. \overline{WE} is HIGH for read cycle.
- 31. For all dual chip enable devices, \overline{CE} is the logical combination of \overline{CE}_1 and CE_2 . When \overline{CE}_1 is LOW and CE_2 is HIGH, \overline{CE} is LOW; when \overline{CE}_1 is HIGH or CE_2 is LOW, \overline{CE} is HIGH.
- 32. Address valid prior to or coincident with \overline{CE} LOW transition.

Switching Waveforms (continued)

Notes

- 33. For all dual chip enable devices, \overline{CE} is the logical combination of \overline{CE}_1 and CE_2 . When \overline{CE}_1 is LOW and CE_2 is HIGH, \overline{CE} is LOW; when \overline{CE}_1 is HIGH or CE_2 is LOW, \overline{CE} is HIGH.
- 34. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
- 35. Data I/O is in the high-impedance state if $\overline{CE} = V_{IH}$, or $\overline{OE} = V_{IH}$.
- 36. During this period, the I/Os are in output state. Do not apply input signals.

Notes

37. For all dual chip enable devices, \overline{CE} is the logical combination of \overline{CE}_1 and CE_2 . When \overline{CE}_1 is LOW and CE_2 is HIGH, \overline{CE} is LOW; when \overline{CE}_1 is HIGH or CE_2 is LOW, \overline{CE} is HIGH.

38. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

39. Data I/O is in high impedance state if $\overline{CE} = V_{IH}$, or $\overline{OE} = V_{IH}$.

40. The minimum write cycle pulse width should be equal to the sum of the t_{HZWE} and t_{SD} .

41. During this period I/O are in the output state. Do not apply input signals.
