

# LED driver series for LCD back light

## White LED driver for medium sized and large sized LCD back light

**BD9470AEFV · BD9470AFM**

### ●General Description

BD9470AEFV and BD9470AFM are high efficiency driver for white LED. They are designed for large sized LCD. BD9470AEFV and BD9470AFM are built-in DCDC converter that supply appropriate voltage for light source.

BD9470AEFV and BD9470AFM are also built-in protection function for abnormal state such as OVP: over voltage protection, OCP: over current limit protection of DCDC, SCP: short circuit protection, open detection of LED string.

Thus they are used for conditions of large output voltage and load conditions.

### ●Features

- 6ch LED constant current driver
- LED maximum output current 250mA
- Individual PWM dimming modulation allowed for LEDs
- $\pm 2\%$  LED current accuracy (when each LED is set to 130mA)
- Built-in LED feedback voltage automatic adjustment circuit according to LED current
- Built-in start-up circuit independent of PWM light modulation
- built-in VOUT · FB voltage maintenance function when PWM=Low (0%)
- Built-in LED current stabilization circuit while scanning operation is performed
- Built-in VOUT discharge circuit while shutdown
- Built-in LED protection (OPEN / SHORT protection)
- Individual detection and individual LED OFF for both open and short circuit
- Adjustable LED short-circuit protection threshold
- PWM-independent LED protection
- VOUT over voltage protection (OVP) and reduced voltage protection (SCP) circuit
- Built-in failure indication function
- Built-in ISET pin short-circuit protection circuit

### ●Typical Application Circuit

Figure 3. Typical Application Circuit

### ●Key Specifications

- VCC supply Voltage range: 9.0V~35.0V
- LED minimum output current: 40mA
- LED maximum output current: 250mA
- DCDC oscillation frequency: 150KHz(RT=100Kohm)
- Operation circuit current: 6mA(typ.)
- Operating temperature range: -40°C~85°C

### ●Applications

- LED driver for TV, monitor and LCD back light

### ●Package

HSOP-M28  
HTSSOP-B28

W (Typ.) x D(Typ.) x H(Max.)  
18.50mm x 9.90mm x 2.41mm  
9.70mm x 6.40mm x 1.00mm

● Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Rating	unit
OVP Detect Voltage (DCDC Stop)	VCC	-0.3~36	V
LED1~6 pin voltage	LED1~6	-0.3~40	V
STB · FAIL · UVLO · OVP pin voltage	STB,FAIL,UVLO,OVP	-0.3~36	V
ISET · FB · SS · CS · N · REG58 · RT pin voltage	ISET · FB · SS · CS · N · REG58 · RT	-0.3~7	V
PWM1~6 · LSP	PWM1~6 · LSP	-0.3~16	V
Power dissipation (HSOP-M28)*1	Pd	5208	mW
Power dissipation (HTSSOP-B28)*2	Pd	4700	mW
Operating temperature range	Topr	-40~+85	°C
Storage temperature range	Tstg	-55~+150	°C
Maximum junction temperature	Tjmax	+150	°C

\*1 Decreases -41.7mW/°C at Ta=25°C or higher (When mounting a four-layer 70.0mmx70.0mmx1.6mm board)

\*2 Decreases -37.6mW/°C at Ta=25°C or higher (When mounting a four-layer 70.0mmx70.0mmx1.6mm board)

● Recommended Operating Ratings

Parameter	Symbol	Rating	unit
Supply voltage	VCC	9.0 ~ 35.0	V
LED1-4 pin minimum output current	ILED_MIN	40	mA*1
LED1-4 pin maximum output current	ILED_MAX	250	mA*1*2*3
LSP input voltage range	VLSP	0.3~2.5	V
DC/DC oscillation frequency	fsw	100 ~ 500	kHz
Min. on-duty for PWM light modulation	PWM_MIN	30	µS

\*1 The amount of current per channel

\*2 If LED makes significant variations in its reference voltage Vf, the driver will increase power dissipation, resulting in a rise in package temperature. To avoid this problem, design the board with thorough consideration given to heat radiation measures.

\*3 The LED current can be set up to 250mA

FAIL Pin Leakage current	ILFAIL	-2	0	2	μA	VFAIL=5V

## ● Pin Numbers/Names/Functions

Pin No. HSOP-M28	Pin Name HTSSOP-B28	Symbol	Function
1	8	ISET	LED current setting resistor connection pin
2	9	PWM1	PWM light modulation signal input pin for LED1
3	10	PWM2	PWM light modulation signal input pin for LED2
4	11	PWM3	PWM light modulation signal input pin for LED3
5	12	PWM4	PWM light modulation signal input pin for LED4
6	13	PWM5	PWM light modulation signal input pin for LED5
7	14	PWM6	PWM light modulation signal input pin for LED6
8	15	GND	Ground pin for analog block
9	16	FAIL	Error detection output pin
10	17	OVP	Overvoltage protection detection pin
11	18	LED6	LED output 6
12	19	LED5	LED output 5
13	20	LED4	LED output 4
14	21	LED_GND	Ground pin for LED
15	22	LED3	LED output 3
16	23	LED2	LED output 2
17	24	LED1	LED output 1
18	25	UVLO	Detection pin for Under voltage Lockout prevention
19	26	LSP	LED short-circuit protection voltage setting pin
20	27	STB	Enable pin
21	28	VCC	Power supply pin
22	1	REG58	5.8V regulator output pin / Shutdown timer pin
23	2	CS	DC/DC output current detection pin OCP detection pin
24	3	N	DC/DC switching output pin
25	4	DCDC_GND	DC/DC GND pin
26	5	RT	DCDC Drive frequency setting connection pin
27	6	FB	Error Amp output pin
28	7	SS	Slow start/ LED protection masking time setting pin

## ● External Component Recommended Range

Parameter	Symbol	Specification	unit
VCC pin connecting capacity	CVCC	0.1 ~ 100	μF
VCC pin connecting resistance	RVCC	0 ~ *1	kΩ
REG58 pin connecting capacity	C_REG	1.0~470	μF
Soft start setting capacity	CSS	0.001~1.0	μF
RT pin connection resistance range	RRT	30~150	kΩ
ISET pin connecting resistance range	RISET	12.16~75	kΩ

The operating conditions listed above are constants for the IC alone. To make constant setting with practical set devices, utmost attention should be paid.

\*1 Please refer to [3.2 function explanation and selection of external components for this selection of VCC series resistance.

● Pin Functions

○ ISET (HTSSOP-B28:8PIN/HSOP-M28 : 1PIN)

The ISET pin is a resistor value of output current setting. The output current ILED vary in inverse proportion to resistor value. The relation of the output current ILED and ISET pin connecting resistor Riset are as below.

$$R_{ISET} = \frac{3000}{I_{LED}[mA]} [k\Omega]$$

However, current setting range is from 40mA to 150mA. And the setting of ISET resistor is below at using 150mA to 250mA.

$$R_{ISET} = 2653 \times (I_{LED}[mA])^{-0.9753} [k\Omega]$$

ILED(mA)	150	160	170	180	190	200	210	220	230	240	250
RSET(kohm)	20.00	18.80	17.72	16.76	15.90	15.12	14.42	13.78	13.19	12.66	12.16

For a setting example, please refer to '3.1 application explanation / LED current setting'. When the Riset is shorted and the ISET pin is grand shorted, the LED current is OFF and the FAIL=OPEN(abnormal signal) to prevent flowing a large current to LED pin when it becomes less than VISET × 0.90V(typ). When the ISET pin back to normal state the LED current return to former system, too and the FAIL=GND(normal signal). It prepare automatically to suitable LED feedback voltage that can output LED current set by ISET pin. In short LED feedback voltage is dropped when the LED current is small and the IC heating is held automatically. In case of a large current is needed, raise the LED pin feedback voltage. And it adjust automatically to LED pin voltage that can be flow large LED current. The calculation is as below.

$$V_{LED} = 3.462 \times I_{LED} [A] [V]$$

The LED feedback voltage (VLED) is clamped to 0.4V(typ.) when the LED current (ILED) is less than 115.6mA.

○ PWM1-6 (HTSSOP-B28:9,10,11,12,13,14PIN / HSOP-M28 : 2,3,4,5,6,7PIN)

The ON/OFF pin for LED driver. Light can be modulated by changing the duty cycle through the direct input of a PWM light modulation signal in each PWM pin.

The high and low voltage levels of PWM\_x pins are as listed in the table below.

State	PWMxvoltage
LED ON state	PWMx=1.5V~15.0V
LED OFF state	PWMx= - 0.3V~0.8V

The sequence of STB/PWM for start-up, please input PWM signal before STB or the same timing STB=PWM=ON.

○ GND (HTSSOP-B28:15PIN / HSOP-M28 : 8PIN)

IC internal analog GND pin.

○ FAIL (HTSSOP-B28:16PIN / HSOP-M28 : 9PIN)

FAIL signal output pin (OPEN DRAIN).Internal NMOS will become OPEN while abnormal is detected.

State	FAILoutput
Normal	GND
Abnormal(After Timer Latch)	OPEN Level

○ OVP (HTSSOP-B28:17PIN / HSOP-M28 : 10PIN)

The OVP pin is an input pin for overvoltage protection and short circuit protection of DC/DC output voltage. If over voltage is detected, the OVP pin will stop the DC/DC converter conducting step-up operation. If Vout was increased by abnormality, timer is set while OVP>2.9V(typ.).when it comes to OVP>3.0V, timer will ON at the same time and to stop DCDC. Although Counter will be stopped when OVP<2.9V during counting time, in the state of OVP>2.9V, when internal counter completed 2<sup>18</sup>count (262152 count), the system will be latched.

When the short circuit protection (SCP) function is activated, the DC/DC converter will stop operation, and then the timer will start counting, after 2<sup>16</sup> count (65536 count), DCDC and LED driver will stop and latch.

The OVP pin is of the high impedance type and involves no pull-down resistor, resulting in unstable potential in the open-circuit state. To avoid this problem, be sure to make input voltage setting with the use of a resistive divider or otherwise. OVP pin will be feedback pin when PWM=L. Also, this pin will hold OVP voltage at that time when switch PWM = H to L.

For setting example, refer to information in "3.4 Selection of External Components-OVP/SCP setting procedure". OVP Voltage keep internal IC with PWM=Low timing, and VOUT voltage can hold by using copied OVP voltage while PWM=Low.(The OVP keep voltage range is 0~3V, 30steps).For setting example, refer to information in "3.2 Selection of External Components", "Explanation of VOUT(OVP) voltage holding function when PWM=Low"

○LED1-6 (HTSSOP-B28:18,19,20,22,23,24PIN / HSOP-M28 : 11,12,13,15,16,17PIN)

LED constant current output pins. Current value setting can be made by connecting a resistor to the ISET pin.

For the current value setting procedure, refer to the description of "ISET pin".

If any of the LED pins is put in an abnormality state (short circuit mode, open circuit mode, ground short mode), the relevant protection function will be activated.

· LED pin short circuit protection function ( LSP)

When any LED is in short state (more than LED=9.0V(typ)) the LED SHORT is detected.

After abnormal detection, the timer count starts. The LED that is abnormal detection after 2<sup>16</sup> count is stopped and other LED driver operates normally.

· LED pin open circuit protection function (LOP)

If any of the LED pins becomes open-circuited (0.2V (Typ.) or less), LED\_OPEN will be detected. When this error is detected, the timer will start counting, When it completes counting the preset period of time, only LED driver that detected the error will stop operation and other LED driver will conduct normal operation.

· LED GND\_SHORT protection function

When any LED pin is GND shorted the LED pin becomes less than 0.20V and the pin is latched because of LED\_OPEN detection. After that, the LED pin is pull upped by inner supply but it continues less than 0.2V state in grand shorted. After detecting timer of open state, if the grand shorted (open) state continues 2<sup>7</sup> counts all systems are latched.

To prevent the miss detection there is 4 count interval of mask before starting the timer count.

If PWM=H time is

PWM=H time < 4count · · · Not detect protection because it is in interval time

PWM=H time > 4count · · · Detect protection because it is out of interval time

Please verify enough to operate narrow PWM.

Figure 14. Timing chart of timer count

○LED\_GND (HTSSOP-B28:21PIN / HSOP-M28 : 14PIN)

The LED\_GND pin is a power ground pin used for the LED driver block.

○UVLO (HTSSOP-B28:25PIN / HSOP-M28 : 18PIN)

This pin is used to for step-up DC/DC converter. When UVLO pin voltage reaches 3.0V (Typ.) or more, IC will initiate step-up operation. If it reaches 2.7V (Typ.) or less, the IC will stop the step-up operation.

The UVLO pin is of the high impedance type and involves no pull-down resistor, resulting in unstable potential in the open-circuited state. To avoid this problem, be sure to make input voltage setting with the use of a resistive divider or otherwise.

For calculation examples, refer to information in '3.1 application explanation/UVLO setting procedure'

○LSP (HTSSOP-B28:26PIN / HSOP-M28 : 19PIN)

The setting pin for detection voltage of LED short circuit protection. The LED short circuit detection voltage is set to 9V (Typ.) with the LSP pin being in the open-circuited state. However, making a change to the LSP pin input voltage will allow the threshold for LED short circuit protection to be changed.

The relation between the LSP pin voltage and the LED short circuit protection detection voltage is given by the following equation.

$$VLSP_{SHORT} = \frac{VLED_{SHORT}}{10} \quad [V]$$

Here LED<sub>SHORT</sub>: LED detection voltage  
VLSP: LSP setting voltage

LSP pin input voltage setting should be made in the range of 0.3V to 2.5V.

For setting example, refer to information in '3.1 application explanation/LSP setting procedure'

**OSTB** (HTSSOP-B28:27PIN / HSOP-M28 : 20PIN)

The pin is used to ON/OFF the IC and allowed for use to reset the IC from shutdown.

The IC state is switched between ON and OFF state according to voltages input in the STB pin. Avoid using the STB pin between two states (0.8 to 2.0V).

Input sequence of STB/PWM for startup, please input PWM before STB or at the same timing.

While in shutdown mode, the timer keeps counting until the IC is completely shut down. For details of shutdown operation, refer to information in '3.1 application explanation/ the setting of REG58 capacity and shutdown procedure'

**OVCC** (HTSSOP-B28:28PIN / HSOP-M28 : 21PIN)

IC power supply pin. Input range is 9~35V.

VCC pin voltage reaches 7.5V (Typ.) or more, the IC will initiate operation. If it reaches 7.2V (Typ.) or less, IC will be shut down.

**OREG58** (HTSSOP-B28:1PIN / HSOP-M28 : 22PIN)

The REG pin is used in the DC/DC converter driver block to output 5.8V voltage. The maximum operating current is 15mA. Using the REG pin at a current higher than 15mA can affect the N pin output pulse, causing the IC to malfunction and leading to heat generation of the IC itself. To avoid this problem, it is recommended to make load setting to the minimum level.

In addition, The REG58 pin is also allowed for use as discharge timer for DC/DC output capacitance.

For details, refer to information in '3.1 application explanation/ the setting of REG58 capacity and shutdown procedure'

**OCS** (HTSSOP-B28:2PIN / HSOP-M28 : 23PIN)

The CS pin has the following two functions.

## 1. DC/DC current mode current feed Back function

Current flowing through the inductor is converted into voltage by the current sensing resistor RCS which connected to CS pin and this voltage is compared with voltage set with the error amplifier to control the DC/DC output voltage.

## 2. Inductor current limit function (OCP pin)

The CS pin also incorporates the overcurrent protection (OCP) function. If the CS pin voltage reaches 0.4V (Typ.) or more, switching operation will be forcedly stopped.

For detailed explanation, Please refer to information in "3.2 Selection of DC/DC Components-OCP setting procedure / DC/DC component current tolerance selection procedure".

**ON** (HTSSOP-B28:3PIN / HSOP-M28 : 24PIN)

The N pin is used to output power to the external NMOS gate driver for the DC/DC converter in the amplitude range of approximately 0 to 5.8V. Frequency setting can be adjusted by a resistor connected to the RT pin. For details of frequency setting, refer to the description of the RT pin.

**ODCDC\_GND** (HTSSOP-B28:4PIN / HSOP-M28 : 25PIN)

The DCDC\_GND pin is a power ground pin for the driver block of the output pin N.

**ORT** (HTSSOP-B28:5PIN / HSOP-M28 : 26PIN)

The RT pin is used to connect a DC/DC frequency setting resistor. DC/DC drive frequency is determined by connecting the RT resistor.

•Relationship between Drive frequency and RT resistance (Ideal)

$$R_{RT} = \frac{15000}{f_{SW} [kHz]} [k\Omega]$$

However, drive frequency setting is limited in the range of 100 kHz to 500kHz.

For calculation, refer to information in '3.1 application explanation/ DC/DC converter drive frequency setting'

When it reaches under  $V_{RT} \times 0.90V$  (typ), DCDC operation will be stopped in order to prevent from high speed oscillation when the RT resistance is shorted to GND. And when RT pin returns to normal state, DCDC also returns to operation.

**OFB** (HTSSOP-B28:6PIN / HSOP-M28 : 27PIN)

The FB pin is an output of DC/DC current mode error amplifier. FB pin detects the voltages of LED pins (1 to 6) and controls inductor current so that the pin voltage of the LED located in the row with the highest Vf will come to 0.45V(130mA, typ.). Therefore, the pin voltages of other LEDs will become higher by Vf variation.

FB Voltage keep internal IC with PWM=Low timing, and it can hold by using copied FB voltage while PWM=Low. (The FB keep voltage range is 0~4V, 40steps)

For setting example, refer to information in '3.1 application explanation/ the necessity for holding output voltage and FB voltage while PWM=Low'

**OSS** (HTSSOP-B28:7PIN / HSOP-M28 : 28PIN)

Soft start time and duty for soft start setting pin. The SS pin normally sources 2.0uA (Typ.) of current.

The IC has a built-in soft start start-up circuit independent of PWM light modulation, and thereby raises FB voltage as SS pin voltage rises independent of the duty cycle range of PWM light modulation. When the SS pin voltage reaches 3.7V (Typ.), soft start operation will be completed to unmask the LED protection function.

For setting example, refer to information in '3.1 application explanation/ start-up and SS capacity setting explanation'

3. Application of BD9470AEFV · BD9470AFM

3.1 BD9470AEFV · BD9470AFM examination for application

●Start-up and SS capacity setting explanation

This section described the start-up sequence of this IC.

Figure 15. Timing chart of start-up

○Description of start-up sequence

- ①STB=PWM=ON
- ②System is ON.SS starts to charge.  
At this time, a circuit in which SS voltage for slow start is equal to FB voltage regardless of whether the PWM pin is set to Low or High level.
- ③Since the FB pin and SS pin reach the lower limit of the internal sawtooth wave, the DC/DC converter operates and VOUT voltage rising.  
Until it reaches a certain voltage even PWM=Low by vltage maintenance function.  
(For detailed OVP maintenance function, please refer to"VOUT(OVP) maintenance function section".)
- ⑤Vout voltage continues rising to reach a voltage at which LED current starts flowing.
- ⑥When the LED current reaches the set amount of current, isolate the FB circuit from the SS circuit. With this, the start-up operation is completed. (Fast start-up is also disabled by VOUT maintenance function)
- ⑦After that, conduct normal operation following the feedback operation sequence with the LED pins.  
If the SS pin voltage reaches 3.7V or more, the LED protection function will be activated to forcedly end the SS and FB equalizing circuit.

○ SS capacity setting method

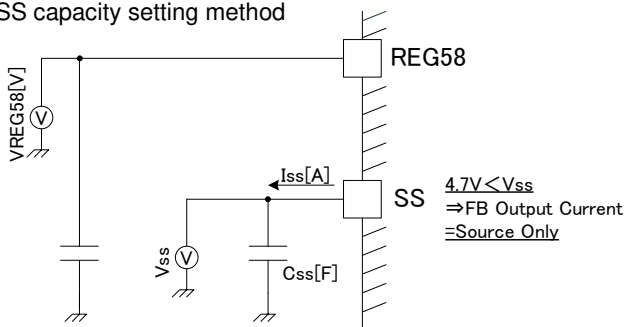

Figure 16. SS setting procedure in FB Source mode

Boot system as above described, because of start-up in the state of FB=SS, the start-up time can be imaged of the time to reach the point from the feedback voltage FB from STB = ON.If you SS> 4.9V, FB output current mode will become Source mode operation.

If the feedback voltage of FB is the same as VSS and the time can be calculated as below.

$$T_{ss} = \frac{C_{ss}[F] \times VF[B]}{2[\mu A]} \quad [Sec]$$

However, if SS is set too short, inductor rush current will occur during start-up. In addition, if SS time is set too long, will result in the brighter in stages. SS capacity will varies with various factors, such as voltage step-up ratio, DCDC driver frequency, LED current and output output condenser, so it is recommended to test and confirm on the actual system. (SS capacity is often set at about 0.047uF~0.47uF approximately as a reference value)

○Setting example

SS time when the start-up is complete and  $C_{ss} = 0.1\mu\text{F}$ ,  $I_{ss} = 2\mu\text{A}$ ,  $V_{ss} = 3.7\text{V}$  will be calculated as follows.

$$T_{ss} = \frac{0.1 \text{E}^{-6} [\text{F}] \times 3.7 [\text{V}]}{2 \text{E}^{-6} [\text{A}]} = 0.185 \text{ [Sec]}$$

In addition, when FB output is operated in Sink/Source mode (refer to “FB pin output current setting for detailed explanation.”), SS voltage can be set to be in the range of 3.9V~4.4V at the SS pin voltage resistor divider. Soft-start time will be set in that case is as follows.

$$T_{ss} = -\frac{1}{A} \ln\left(1 - \frac{A \times V_{ss} [\text{V}]}{B}\right) \text{ [Sec]}$$

$$A = \frac{R1 [\text{ohm}] + R2 [\text{ohm}]}{C_{ss} [\text{F}] \times R1 [\text{ohm}] \times R2 [\text{ohm}]}$$

$$B = \left(\frac{V_{REG58} [\text{V}]}{R1 [\text{ohm}]} + I_{ss} [\text{A}]\right) \div C_{ss} [\text{F}]$$

Figure 17. SS setting procedure in FB sink/ source mode

○Setting example

When  $R1=200\text{kohm}$ ,  $R2=470\text{kohm}$ ,  $C_{ss}=1.0\mu\text{F}$ ,  $V_{REG58}=5.8\text{V}$ ,  $I_{ss}=2\mu\text{A}$ ,  $V_{ss}=3.7\text{V}$ , SS time is set as below

$$T_{ss} = -\frac{1}{7.12} \ln\left(1 - \frac{7.12 \times 3.7}{31}\right) = 0.266 \text{ [Sec]}$$

●The setting of REG58 capacity and shutdown procedure

VOUT discharge function is built-in this IC when IC is shutdown, the below describes the operation sequence.

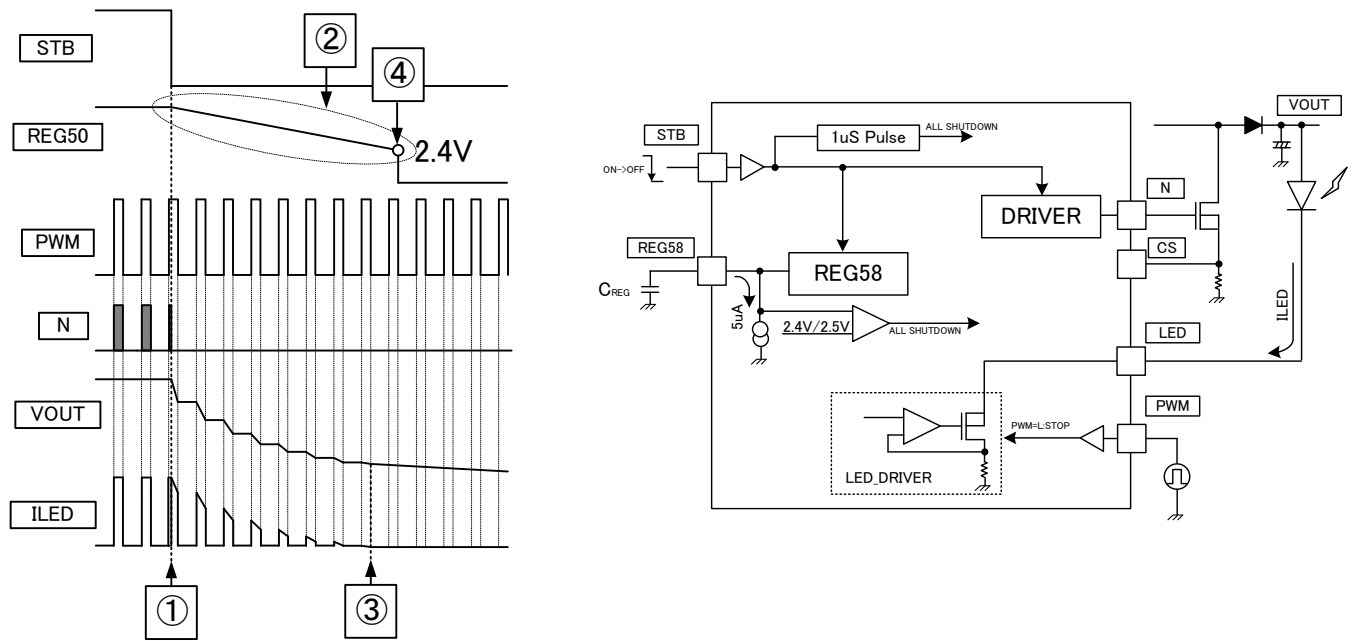

Figure 18. Timing chart of shutdown

○Explanation of shutdown sequence

- ① Set STB pin to “OFF” will stop DC/DC converter and REG58, but LED driver will remain operation. (Reset signal is output 1uS extent to reset the latch on the IC at this time. Therefore, undershooting will be generated on LED current, but 1uS is very short will not affect the brightness.)
- ② Discharge the REG58 pin voltage from 5.8V to 2.4V with -5uA current.
- ③ The VOUT voltage will be fully discharged with ILED current and the ILED current will no longer flow.
- ④ When REG58 pin voltage will reach 2.4V (Typ.) or less to shut down all systems

○REG58 capacitance setting procedure

The shutdown time “T<sub>OFF</sub>” can be calculated by the following equation.

$$T_{OFF} = \frac{C_{REG}[F] \times 3.4 [V]}{5 [\mu A]} \quad [Sec]$$

The longest VOUT discharge time will be obtained when the PWM duty cycle is set to the minimum VOUT. Make REG capacitance setting with an adequate margin so that systems will be shut off after VOUT voltage is fully discharged.

● VCC series resistance setting procedure

By inserting a series resistor to VCC will has the following affection.

- ① Reduce the voltage VCC, and it is possible to suppress the heat generation of IC.  
( $ICC \times VIN$  is power consumption of IC)
- ② Possible to Raise the surge ability to VCC.

However, if resistance is set too large, it is needed to consider that will result in VCC become  $VCC < 9V$  (Minimum operation voltage). So the appropriate series resistance setting is needed.

The current influx of IC  $I_{IN}$  as shown on the right is

- Circuit current of IC... $ICC$
- Current to load is connected to REG58... $I_{REG}$
- Current which used to drive DCDC FET... $IDCDC$

There are 3 paths within IC and the  $\Delta V$  of RVCC can be decided. VCC voltage generated by the relation as above described at that time can be represented as below.

$$VCC[V] = VIN[V] - (ICC[A] + IDCDC[A] + IREG[A]) \times RVCC[\Omega] \quad [V] > 9[V]$$

The Criterion of 9V is the minimum operating limit of the IC.

When a series resistance is considered, please set with a sufficient margin.

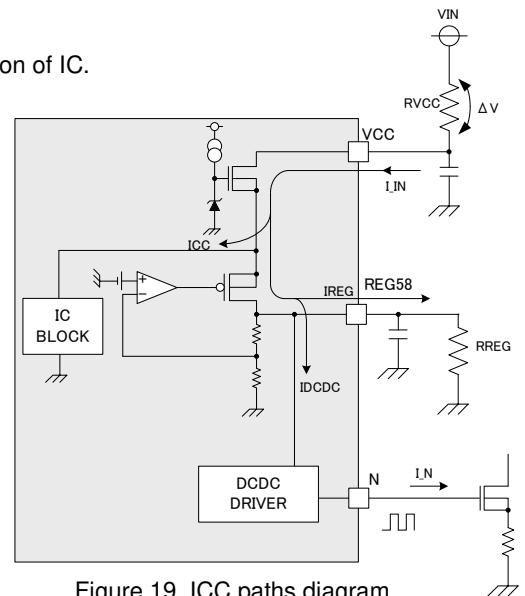

Figure 19. ICC paths diagram

○ Setting example

Above equation can be transformed as below.

$$RVCC[\Omega] < \frac{VIN[V] - 9[V]}{ICC[A] + IDCDC[A] + IREG[A]}$$

In typical operation,  $VIN=24V$ ,  $ICC=5.5mA$ ,  $RREG=10k\Omega$ ,  $IDCDC=2mA$  can be assumed and the VCC voltage is

$$RVCC[\Omega] < \frac{24[V] - 9[V]}{0.0055[A] + 0.002[A] + 5.8[V]/10000[\Omega]} = 1.86[k\Omega]$$

However, the result is in typical operation and the variability and margin is not considered.

If the variability of  $VIN=24V \times (-20\%)$ ,  $ICC=8.5mA$ ,  $RREG=10k \times (-5\%)$ ,  $REG58=5.8V \times (+5\%)$ ,  $IDCDC=2mA \times (+100\%)$ ,  $VCC$  operation limit voltage  $9V \times (+20\%)$  are assumed:

$$RVCC[\Omega] < \frac{24 \times 0.8[V] - 9 \times 1.2[V]}{0.0085[A] + 0.002 \times 2[A] + 5.8 \times 1.015[V]/(10000[\Omega] \times 0.95)} = 640[\Omega]$$

According to above result, set  $RVCC = 640\Omega$  or less is adequate on actual application.

When a series resistance is considered, please set with a sufficient margin.

●The necessity for holding output voltage and FB voltage while PWM=Low

In conventional control method, DCDC will be stopped and FB voltage become high impedance while PWM=Low. However, if PWM=0% is continued to inputted to system, output voltage and FB voltage is reduced because of discharge phenomenon. eventually output voltage is equal to VIN, and FB voltage drop to 0V. There are several problems such as the following listed if PWM dimming signal is tried to light-up a system.

- ① Slow start cannot be controlled resulting in the FB voltage overshoot and rush current flow to Inductor.
- ② Flash phenomenon occur due to start-up control does not work.
- ③ Because there is a need to re-boost, take a long time to light up.

In this IC, the problems as above mentioned is resolved by coping output voltage and FB voltage to IC internally at a time of PWM from High to Low.

The below describes FB and VOUT voltage holding function in detail.

○Explanation of FB voltage holding function while PWM=Low

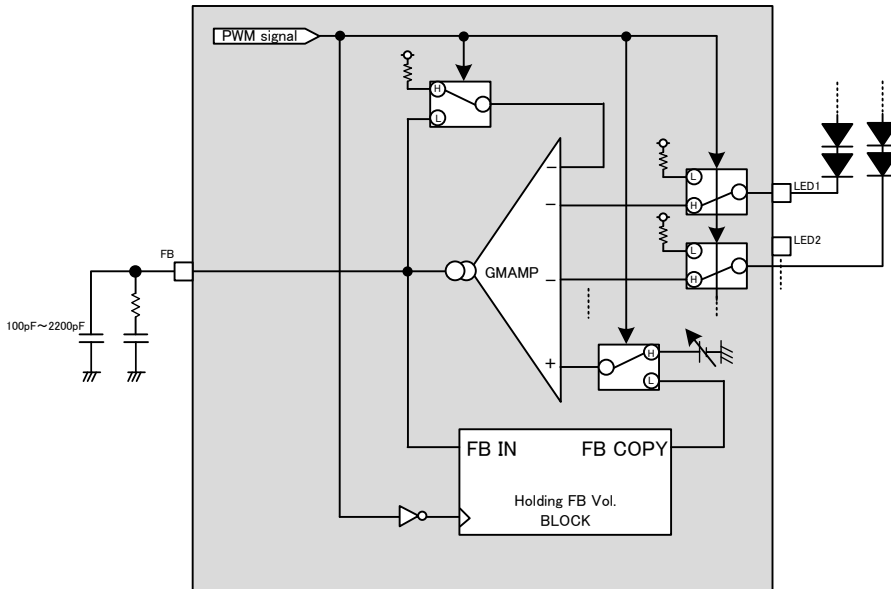

Figure 20. Block diagram of KEEP\_FB

FB holding function means FB voltage will be copy to IC internally at a time of PWM from High to Low, FB voltage will be maintained even in the period of PWM=Low.

Because FB voltage resolution is split by 40 from 4V, so the voltage can be copied to IC internally in 0.1V Step.

In addition, FB pin voltage will be influenced by DCDC operation, the copied have ±0.1V difference problem. But because FB voltage is returned as feedback voltage immediately and will not cause an operational problem while PWM=H, it is recommended to add about 100pF~2200pF to FB pin for noise reduction.

Figure 21. Timing chart of KEEP\_FB

- ① PWM=High, normal feedback operation by LED pin
- ② FB voltage is copied to IC at a time of PWM from High to Low. FB voltage will be copied by less than 1Bit.  
For Example : when FB=2.16V, FB COPY voltage is 2.1V.
- ③ GMAMP is works as Buffer with while PWM=Low, FB voltage is discharged to FB COPY voltage.
- ④ FB COPY=FB voltage.
- ⑤ FB COPY=FB voltage and maintain.

If PWM=0% and because follow the state⑤ continuously, FB voltage will not dropped by natural discharge.

※Notice

FB voltage holding function is performed at 0.1V STEP. If PWM signal is in low duty, FB voltage is not able to rise sufficiently when FB series resistance is small causing to  $R_{FB} \times I_{FB}(\text{typ. } 100\mu\text{A}) < 0.1\text{V}(\text{typ.})$ , The output voltage may not be boosted up to the set voltage.  
Therefore, it is recommended to set  $R_{FB} > 2\text{kohm}$  so that  $\Delta V = R_{FB} \times I_{FB} > 0.2\text{V}$ .

Figure 22. Voltage to FB resistor

●Explanation of VOUT(OVP) voltage holding function when PWM=Low

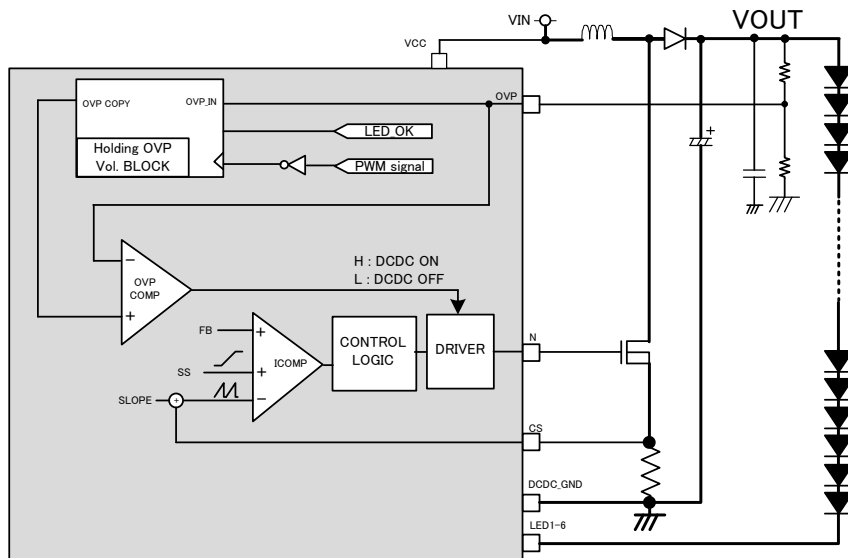

Figure 23. Block diagram of KEEP\_OVP

OVP holding function means VOUT(OVP) voltage will be copy to IC internally at a time of PWM from High to Low, voltage will be maintained even in the period of PWM=Low.  
 In addition to measures of the above problems, by applying this function, the high-speed start-up can be achieved without depending on the PWM.  
 Because VOUT voltage resolution is the same as FB holding function which is split by 40 from 4V,so the voltage can be copied to IC internally in 0.1V Step.  
 The description of OVP holding function is divided into narrow PWM operation and start-up operation.

○Explanation of OVP holding function at start-up

Figure 24. Timing chart 1 of KEEP\_OVP

In order to launch high speed start-up without depending on the PWM DUTY, OVP holding function will behave like the following descriptions.  
 ①PWM=High, normal boost operation.  
 ②OVP voltage is copied into IC when PWM is from High to Low.OVP voltage will be copied upper 1BIT at this time. For example: if OVP=2.43V, the copied voltage is 2.5V in IC.  
 ③The copied OVP voltage will be compared with OVP pin voltage internally, if OVP\_COPY>OVP, DCDC is operated.In other words, it is possible to achieve fast start-up by letting the voltage on the 1BIT boosted up in the interval of PWM = Low.  
 ④When OVP\_COPY<OVP pin voltage, DCDC is stopped.  
 ⑤Even if in the period of PWM=Low and VOUT is discharged, output voltage will be hold by performing DCDC operation in order to let OVP\_COPY<OVP pin voltage.

## ○Explanation of OVP holding function in narrow PWM duty

Figure 25. Timing chart 2 of KEEP\_OVP

DCDC operates only in the duration of PWM=High while narrow PWM is inputted, output voltage drops when PWM=0%. But, DCDC is operated by coping voltage even if PWM=Low duration in this IC and output voltage will not drops.

①PWM=High, normal operation.

②OVP voltage is copied into IC when PWM is from High to Low.OVP voltage will be copied under 1BIT at this time. For example: if OVP=2.43V, the copied voltage is 2.4V in IC.

③VO<sub>UT</sub> is discharged by OVP resistance.

④When copied OVP\_COPY > OVP pin voltage, DCDC is operated, when OVP\_COPY < OVP voltage, DCDC is stops.

When operates in PWM=0%, the point④ will be repeated and repeated, so the output voltage will not drops naturally.

## ○Condition of copy OVP voltage

The copied OVP pin voltage as above explanation, it has upper and lower 1BIT difference according to below condition.

Conditions of copy upper 1BIT

: From startup to completion of step-up

: OVP detection state

Conditions of copy lower 1BIT

: Normal operation state ( OVP undetected state)

※The reason about why copy the voltage of upper 1BIT when OVP is detected

When OVP is detected by OVP=3V and stops DCDC operation. After that while PWM=Low and if copy lower 1BIT voltage will results in OVP=2.9V and release OVP detection function, therefore it is designed to copy upper 1BIT when OVP is detected.

●FB current Source mode - Sink/Source mode

The output of GMAMP is constant current control in normal operation and output  $I_{out} \pm 100\mu A$  (typ.) in this IC. But, when PWM scanning operation and local dimming is performed, total LED current and output voltage will differ by each timing and FB feedback voltage. The below describes this operation.

Figure 26. Timing chart of FB sink/source mode

As above shown, short PWM1,2,3 and PWM4,5,6, assumed that scanning operation is performed.

At this time, the sequence is described as below.

- ① When PWM4,5,6=High→Low, FB voltage, VOUT (OVP) voltage is copied
- ② Copied voltage is hold.
- ③ When PWM1,2,3=High again, normal DCDC operation
- ④ When PWM4,5,6=High again, LED current increase.
- ⑤ Because LED current increase resulting in FB voltage change. it takes a long transition time because FB source current is 100uA at this time, therefore FB voltage is not sufficient and output voltage and LED current will drop.
- ⑥ FB voltage reaches the feedback voltage and LED current and output voltage will operate normally.

In other words, ILED current drops at the point ⑤, This may be due to the transition time of the behavior that FB current sinks first and then charges again.

Therefore, in order to solve this problem in this IC, equipped with a mode of “FB current only source 0uA~+100uA” as a countermeasure to reduce the LED current drop problem.  
“FB Source mode” is described as below.

Figure 27. Timing chart of FB source mode

- ① when PWM4,5,6=High→Low, FB voltage, VOUT (OVP) voltage is copied
- ② copied voltage is hold.
- ③ when PWM1,2,3=High again, normal DCDC operation.but, FB voltage is larger than feedback voltage, and VOUT setting voltage also higher.
- ④ when PWM4,5,6=High, LED current increases.
- ⑤ although LED current is increased but the FB voltage has reached the feedback voltage and will not change at this time. Therefore, there is no transition and VOUT, LED current will not drop.
- ⑥ LED current and output voltage is operate normally
- ⑦ When PWM1,2,3=Low, LED current reduces. But, FB is only has source ability, FB voltage is maintained continually (But, despite the decreasing of LED current, output voltage is increases because FB voltage is not changed.)

According to above operation, the LED undershoot problem can be prevented by FB source mode.

However, the above description is a simplified explanation for behavior, because the actual behavior of a waveform is different from the above, please check on the actual system.

When FB source mode is used, care must be taken to the following contents.

Because it can be held at a higher voltage than normal FB voltage, output voltage may be higher. Therefore, please note that the heat might be higher than PWM = 100% while scanning operation is performed.

●LED Current setting

Setting of LED output current “ILED” can be made by connecting a resistor R<sub>ISET</sub> to the ISET pin.  
R<sub>ISET</sub> and ILED current setting equation

$$R_{ISET} = \frac{3000}{I_{LED}[mA]} \quad [k\Omega]$$

However, LED current setting should be made in the range of 40mA to 150mA.  
And the setting of ISET resistor is below at using 150mA to 250mA.

$$R_{ISET} = 2653 \times (I_{LED}[mA])^{-0.9753} \quad [k\Omega]$$

ILED(mA)	150	160	170	180	190	200	210	220	230	240	250
RSET(kohm)	20.00	18.80	17.72	16.76	15.90	15.12	14.42	13.78	13.19	12.66	12.16

○Setting Example

To set ILED current to 100mA, R<sub>ISET</sub> resistance is given by the following equation

$$R_{ISET} = \frac{3000}{I_{LED}[mA]} = \frac{3000}{100[mA]} = 30 \quad [k\Omega]$$

●DC/DC converter drive frequency setting

DC/DC converter drive frequency is determined by making R<sub>T</sub> resistance setting.

○Drive frequency vs. R<sub>T</sub> resistance (ideal) equation

$$R_{RT} = \frac{15000}{f_{sw}[kHz]} \quad [k\Omega]$$

Here f<sub>sw</sub> = DC/DC converter oscillation frequency [kHz]

This equation has become an ideal equation without any correction item included.  
For accurate frequency settings, thorough verification should be performed on practical sets.

○Setting example

To set DC/DC drive frequency “f<sub>sw</sub>” to 200 kHz, R<sub>RT</sub> is given by the following equation

$$R_{RT} = \frac{15000}{f_{sw}[kHz]} = \frac{15000}{200[kHz]} = 75 \quad [k\Omega]$$

And , the drive frequency setting range is 100kHz~500kHz.

●UVLO setting procedure

UVLO pin for step-up DC/DC power supply. If the UVLO pin voltage reaches 3.0V (Typ.) or more, the IC will start step-up operation. If it reaches 2.7V (Typ.) or less, the IC will stop the step-up operation.

UVLO pin is the high impedance type and no pull-down resistor inside, resulting in unstable potential in the open-circuit state. To avoid this problem, be sure to set input voltage with the use of a resistive divider.

While the VIN voltage to be detected is set by the use of resistive dividers R1 and R2 as described below, resistance setting will be made by the following equation.

○UVLO setting procedure

Assume that VIN is reduced and detected,

UVLO is "VIN<sub>DET</sub>", R1 and R2 setting will be made by the following equation:

$$R1 = R2[k\Omega] \times \frac{(VIN_{DET}[V] - 2.7[V])}{2.7[V]} \quad [k\Omega]$$

○UVLO release voltage setting equation

When R1 and R2 setting is determined by the equation shown above, UVLO release voltage will be given by the following equation.

$$VIN_{CAN} = 3.0V \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} \quad [V]$$

Figure 28. Block diagram of UVLO

○Setting example

Assuming that the normal VIN operating voltage is 24V, UVLO detection voltage is 18V, and R2 resistance is 30kΩ, R1 resistance setting is made by the following equation

$$R1 = R2[k\Omega] \times \frac{(VIN_{DET}[V] - 2.7[V])}{2.7[V]} = 30[k\Omega] \times \frac{(18[V] - 2.7[V])}{2.7[V]} = 170 \quad [k\Omega]$$

And, when UVLO release voltage VIN<sub>CAN</sub> setting is made with R1 and R2, it will be given by the following equation

$$VIN_{CAN} = 3.0[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} = 3.0[V] \times \frac{30[k\Omega] + 170[k\Omega]}{30[k\Omega]} [V] = 20 \quad [V]$$

To select DC/DC components, give consideration to IC variations as well as individual component variations, and then conduct thorough verification on actual systems.

●OVP/SCP setting method

The OVP pin is an input pin for overvoltage protection and short circuit protection of DC/DC output voltage. The OVP pin is a high impedance type and no pull-down resistor inside, resulting in unstable potential in the open circuit state. To avoid this problem, be sure to make input voltage setting with the use of a resistive divider. Conditions for each OVP protections are as listed in the table below.

Protection name	Protection pin	Detection Condition	Release Condition	Timer Operation	Protection type	FAIL pin
OVP Timer SET / OVP Cancel	OVP	OVP>2.9V	OVP<2.9V	Yes	All latch	GND
OVP Detect / DCDC STOP	OVP	OVP>3.0V	OVP<3.0V	No	Only DCDC converter stops during detection	OPEN
SCP	OVP	OVP<0.1V	OVP>0.1V	Yes	All latch	GND

The following describes the setting procedures of that VOUT pin voltage to be detected is set by the use of resistive dividers R1 and R2 as shown in the circuit diagram below.

○OVP detection setting method

Assuming that a voltage causing VOUT to abnormally rise and detecting OVP is "VOVP<sub>DET</sub>", R1 and R2 setting will be made by the following equation.

$$R1 = R2[k\Omega] \times \frac{(VOVP_{DET}[V] - 3.0[V])}{3.0[V]} \quad [k\Omega]$$

○Timer set·OVP release setting equation

When R1 and R2 setting is determined by the equation shown above, OVP release voltage VOVP<sub>CAN</sub> will be given by the following equation:

$$VOVP_{CAN} = 2.9V \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} \quad [V]$$

○SCP detection equation

When R1 and R2 setting is determined by the equation shown above, SCP setting voltage VSCP<sub>DET</sub> will be given by the following equation.

$$VSCP_{DET} = 0.1V \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} \quad [V]$$

Figure 29. OVP block diagram

○Setting example

Assuming that normal VOUT voltage is 40V, OVP detection voltage VOVP<sub>DET</sub> is 48V, and R2 resistance is 10kΩ, R1 resistance is calculated by the following equation

$$R1 = R2[k\Omega] \times \frac{(VOVP_{DET}[V] - 3.0[V])}{3.0[V]} = 10[k\Omega] \times \frac{(48[V] - 3[V])}{3[V]} = 150 \quad [k\Omega]$$

When OVP release voltage VOVP<sub>CAN</sub> setting is made with the said R1 and R2, it will be given by the following equation

$$VOVP_{CAN} = 2.9[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} = 2.9[V] \times \frac{10[k\Omega] + 150[k\Omega]}{10[k\Omega]} [V] = 46.4 \quad [V]$$

SCP detection voltage is given by the following equation

$$VSCP_{DET} = 0.1[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} = 0.1[V] \times \frac{10[k\Omega] + 150[k\Omega]}{10[k\Omega]} [V] = 1.6 \quad [V]$$

Give consideration to IC variations as well as individual component variations, and then evaluate on actual systems.

●LSP setting procedure

LED SHORT threshold voltage can be adjusted by setting LSP pin voltage.  
 LED SHORT detection voltage is set to 9V when LSP pin=OPEN state.  
 Please set input voltage of LSP pin from 0.3V~2.5V range.  
 The relation between LSP pins and LED SHORT protection voltage as below.

$$VLSP_{SHORT} = \frac{VLED_{SHORT}}{10} \quad [V]$$

Also, LSP pin divides 4V within the IC using resistive dividers (see the circuit diagram shown below)  
 Therefore, connecting an external resistor to the LSP pin will produce resistance combined with the internal IC resistance.

Consequently, LSP pin voltage setting using external resistive dividers, it is recommended to connect them having resistance little affected by the internal resistance.(Smaller resistance have less influence on internal resistance, but will result in larger power consumption.)

Figure 30. LSP Block diagram

○LSP detection voltage setting

If the setting of LSP detection voltage VLSP is made by dividing the REG58V voltage by the use of resistive dividers R1 and R2, VLSP will be given by the following equation.

$$VLSP = \left( REG58[V] \times \frac{R2[k\Omega]}{(R1[k\Omega] + R2[k\Omega])} \right) \times 10 \quad [V] \dots (1)$$

However, this equation includes no internal IC resistance. If internal resistance is taken into account, detection voltage VLSP will be given by the following equation.

$$VLSP = \left( \frac{R2[k\Omega] \times R4[k\Omega] \times (REG58[V] \times R3 + REF[V] \times R1[k\Omega])}{(R1[k\Omega] \times R3[k\Omega] \times (R2 + R4) + R2[k\Omega] \times R4[k\Omega] \times (R1[k\Omega] + R3[k\Omega]))} \right) \times 10 \quad [V] \dots (2)$$

Make setting of R1 and R2 resistance so that a difference between resistance values found by Equations (1) and (2) will come to approximately 2% or less as a guide.

○Setting example

Assuming that LSP is approximated by Equation (1) in order to set LSP detection voltage to 5V, R1 comes to 53kΩ and R2 comes to 5kΩ. LSP detection voltage taking into account internal IC resistance by Equation (2), it will be given as

$$VLSP = \left( \frac{5[k\Omega] \times 900[k\Omega] \times (5.8[V] \times 3100[k\Omega] + 4[V] \times 53[k\Omega])}{(53[k\Omega] \times 3100[k\Omega] \times (5[k\Omega] + 900[k\Omega]) + 5[k\Omega] \times 900[k\Omega] \times (53[k\Omega] + 3100[k\Omega]))} \right) \times 10 = 5.033V[V]$$

The difference is given as:

$$(5.033[V] - 5[V]) / 5[V] \times 100 = 0.66\%$$

As a result, this setting will be little affected by internal impedance.

●Timer latch function

This IC has a built-in timer latch counter to make setting of timer latch time by counting a clock frequency set with the RT pin.

○Timer latch time

The timer latch counter begins counting from the timing when any abnormal state is detected. The timer will be latched after a lapse of a period of time given by the following equation.  
If the abnormal state continues even when PWM is set to Low level, the counter will not reset counting.

$$LATCH_{TIME} = 2^{16} \times \frac{R_{RT}}{1.5 \times 10^{10}} = 65536 \times \frac{R_{RT} [k\Omega]}{1.5 \times 10^7} [S]$$

Here LATCH<sub>TIME</sub>= A period of time, which the timer is latched  
R<sub>RT</sub>=RT pin connecting resistance

Protection time which described above is applied for LED pin OPEN protection, LED pin SHORT protection, SCP protection.  
The protection of FB overshoot and OVP protection as below:

$$LATCH_{TIME} = 2^{18} \times \frac{R_{RT}}{1.5 \times 10^{10}} = 262144 \times \frac{R_{RT} [k\Omega]}{1.5 \times 10^7} [S]$$

Clock oscillation of timer latch uses DCDC clock. So timer latch time depend on unevenness of DCDC oscillation. In 150kHz, timer latch time is ±5% unevenness.

○Setting Example

In LED\_OPEN protection, LED\_SHORT protection, SCP protection,  
When RT resistance=100kohm, the timer latch time is

$$LATCH_{TIME} = 65536 \times \frac{R_{RT} [k\Omega]}{1.5 \times 10^7} = 65536 \times \frac{100[k\Omega]}{1.5 \times 10^7} = 0.437[S]$$

And, FB overshoot protection, OVP protection is

$$LATCH_{TIME} = 524288 \times \frac{R_{RT} [k\Omega]}{1.5 \times 10^7} = 262144 \times \frac{100[k\Omega]}{1.5 \times 10^7} = 1.75[S]$$

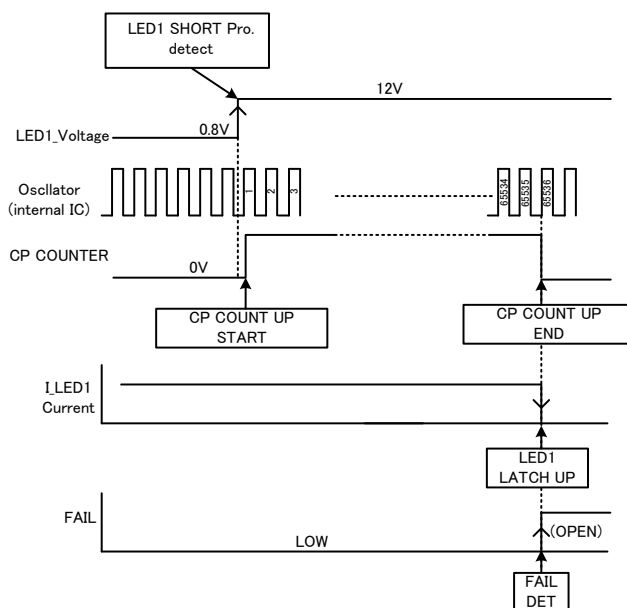

Figure 31. Timing chart of LSP time latch

3.2 Selection of DCDC components

●OCP setting procedure/DCDC component current tolerance selection procedure

The OCP detection function that is one of the functions of the CS pin will stop the DC/DC converter operating if the CS pin voltage becomes greater than 0.4V. Consequently, it is needed to calculate a peak current flowing through the coil L and then review the resistance of RCS. Furthermore, a current tolerance for DC/DC components should be larger than that for peak current flowing through the coil L.

The following section describes the peak coil current calculation procedure, CS pin connection resistor RCS selection procedure, and DC/DC component current tolerance selection procedure

○Calculation of coil current Ipeak

Ripple voltage generated at the CS pin is determined by conditions for DC/DC application components. Assuming the conditions:

output voltage=VOUT [V]

LED total current=IOUT [A]

DCDC input voltage=VIN [V]

DCDC efficiency=η [%]

mean input current IIN required for the whole system is given by the following equation

$$I_{IN} = \frac{V_{OUT}[V] \times I_{OUT}[A]}{V_{IN}[V] \times \eta[\%]} \quad [A]$$

Further, according to drive operation with the DC/DC converter switching frequency fsw [Hz], inductor ripple current ΔIL [A] generated at the inductor L is given by the following equation.

$$\Delta IL = \frac{(V_{OUT}[V] - V_{IN}[V]) \times V_{IN}[V]}{L[H] \times V_{OUT}[V] \times f_{sw}[Hz]} \quad [A]$$

As a result, the peak current Ipeak of IL is given by the following equation.

$$I_{peak} = I_{IN}[A] + \frac{\Delta IL[A]}{2} \quad [A] \cdots (1)$$

○CS pin connection resistor RCS selection procedure

The current Ipeak flows into RCS to generate voltage.(See timing chart shown to the right.)

The voltage VCSpeak is given by the following equation.

$$V_{CS\ peak} = R_{cs} \times I_{peak} \quad [V]$$

If this VCSpeak voltage reaches 0.4V, DC/DC output will stop. Consequently, to select RCS resistance, the following condition should be met.

$$R_{cs}[\Omega] \times I_{peak}[A] < 0.4[V]$$

○DCDC component current tolerance selection procedure

Iocp current needed for OCP detection voltage CS to reach 0.4V is given by the following equation

$$I_{ocp} = \frac{0.4[V]}{R_{cs}[\Omega]} \quad [A] \cdots (2)$$

The relation among Ipeak current (Equation (1)), Iocp current (Equation (2)),

$$I_{peak} < I_{ocp} < \text{Max. current tolerance for component}$$

DC/DC application components including FETs, inductors, and diodes should be selected so that the Equation shown above will be met.

Furthermore, it is recommended to normally use DC/DC application components in continuous mode. Assuming that the lower limit value of coil ripple current is Imin, the following equation should be met

$$I_{min} = I_{IN}[A] - \frac{\Delta IL[A]}{2} > 0$$

A failure to meet this condition is referred to as discontinuous mode.

Figure32.

DCDC application diagram and coil current

## ○Setting example

Output voltage= $V_{OUT}$  [V]=40VLED total current= $I_{OUT}$  [A]=120mA×6ch=0.72ADCDC input voltage= $V_{IN}$  [V]=24VDCDC efficiency= $\eta$  [%]=90%mean input current  $I_{IN}$  required for the whole system is given by the following equation

$$I_{IN} [A] = \frac{V_{OUT} [V] \times I_{OUT} [A]}{V_{IN} [V] \times \eta [\%]} = \frac{40[V] \times 0.72[A]}{24[V] \times 90[\%]} = 1.33 [A]$$

DCDC switching frequency= $f_{sw}$  [Hz]=200kHzInductor  $L$  [H]=47 $\mu$ HThe Inductor ripple current  $\Delta I_L$  [A] is:

$$\Delta I_L = \frac{(V_{OUT} [V] - V_{IN} [V]) \times V_{IN} [V]}{L [H] \times V_{OUT} [V] \times f_{sw} [Hz]} = \frac{(40[V] - 24[V]) \times 24[V]}{47 \times 10^{-6} [H] \times 40[V] \times 200 \times 10^3 [Hz]} = 1.02 [A]$$

As a result, the IL peak current  $I_{peak}$  is:

$$I_{peak} = I_{IN} [A] + \frac{\Delta I_L [A]}{2} [A] = 1.33[A] + \frac{1.02[A]}{2} = 1.84 [A] \quad \dots \text{Result of peak current calculation}$$

When RCS resistance is set to 0.15ohm, the VCS peak voltage will be given by the following equation

$$VCS_{peak} = Rcs \times I_{peak} = 0.15[\Omega] \times 1.84[A] = 0.276[V] < 0.5V \quad \dots \text{Result of review of RCS resistance}$$

Consequently, the result meets the condition.

Furthermore,  $I_{ocp}$  current at which OCP is detected is given by the following equation

$$I_{ocp} = \frac{0.4[V]}{0.15[\Omega]} = 2.67 [A]$$

If the current tolerance for components to be used (e.g. FETs, inductors, diodes) is smaller than 2.5A,

$$I_{peak} < I_{ocp} < \text{Max. Current tolerance for component} = 1.84[A] < 2.67[A] < 3.0[A] \quad \dots \text{Result of review of current tolerance for DC/DC components}$$

As a result, since the condition above is met, the selection of components is accepted.

And, the lower limit of IL ripple current  $I_{min}$  is:

$$I_{min} = I_{IN} [A] - \frac{\Delta I_L [A]}{2} [A] = 1.33[A] - \frac{1.02[A]}{2} = 0.82[A] > 0$$

The system will not be put into discontinuous mode.

To select DC/DC components, please consider IC variations as well as individual component variations, and then conduct thorough verification on practical systems.

● Selection of Inductor

The value of inductor has significant influence on the input ripple current. As shown by Equation (1), the larger the inductor and the higher the switching frequency, the inductor ripple current  $\Delta IL$  becomes increasingly lower.

$$\Delta IL = \frac{(V_{OUT} - V_{IN}) \times V_{IN}}{L \times V_{OUT} \times f_{SW}} [A] \quad \dots \dots (1)$$

Efficiency as shown by Equation (2), peak input current is given as Equation

$$\eta = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times I_{IN}} \quad \dots \dots (2)$$

$$I_{L\_MAX} = I_{IN} + \frac{\Delta IL}{2} = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times \eta} + \frac{\Delta IL}{2} \quad \dots \dots (3)$$

Here,

- L: Reactance value [H]       $V_{OUT}$ : DC/DC output voltage[V]
- $V_{IN}$ : input voltage[V]       $I_{OUT}$ : output current(LED total current)[A]
- $I_{IN}$ : input current[A]       $f_{SW}$ : oscillation frequency[Hz]

If a current in excess of the rated current of the inductor applies to the coil, the inductor will cause magnetic saturation, resulting in lower efficiency.

Select an inductor with an adequate margin so that peak current will not exceed the rated current of the inductor.

To reduce power dissipation from and increase efficiency of inductor, select an inductor with low resistance component (DCR or AC R).

Figure33. DCDC application circuit and coil current

● Selection of switching MOSFET transistors

There will be no problem for switching MOSFET transistors having absolute maximum rating higher than rated current of the inductor L and VF higher than “ $C_{OUT}$  breakdown voltage + Rectifier diode”. However, to achieve high-speed switching, select transistors with small gate capacity (injected charge amount).

- Rated current larger than  $\square$  current protection setting current is recommended
- Selecting transistors with low On resistance can obtain high efficiency.

● Selection of rectifier diodes

Select current capability higher than the rated current of the inductor L and inverse breakdown voltage higher than  $C_{OUT}$  break-down voltage, particularly having low forward voltage VF.

3.3 Timing Chart

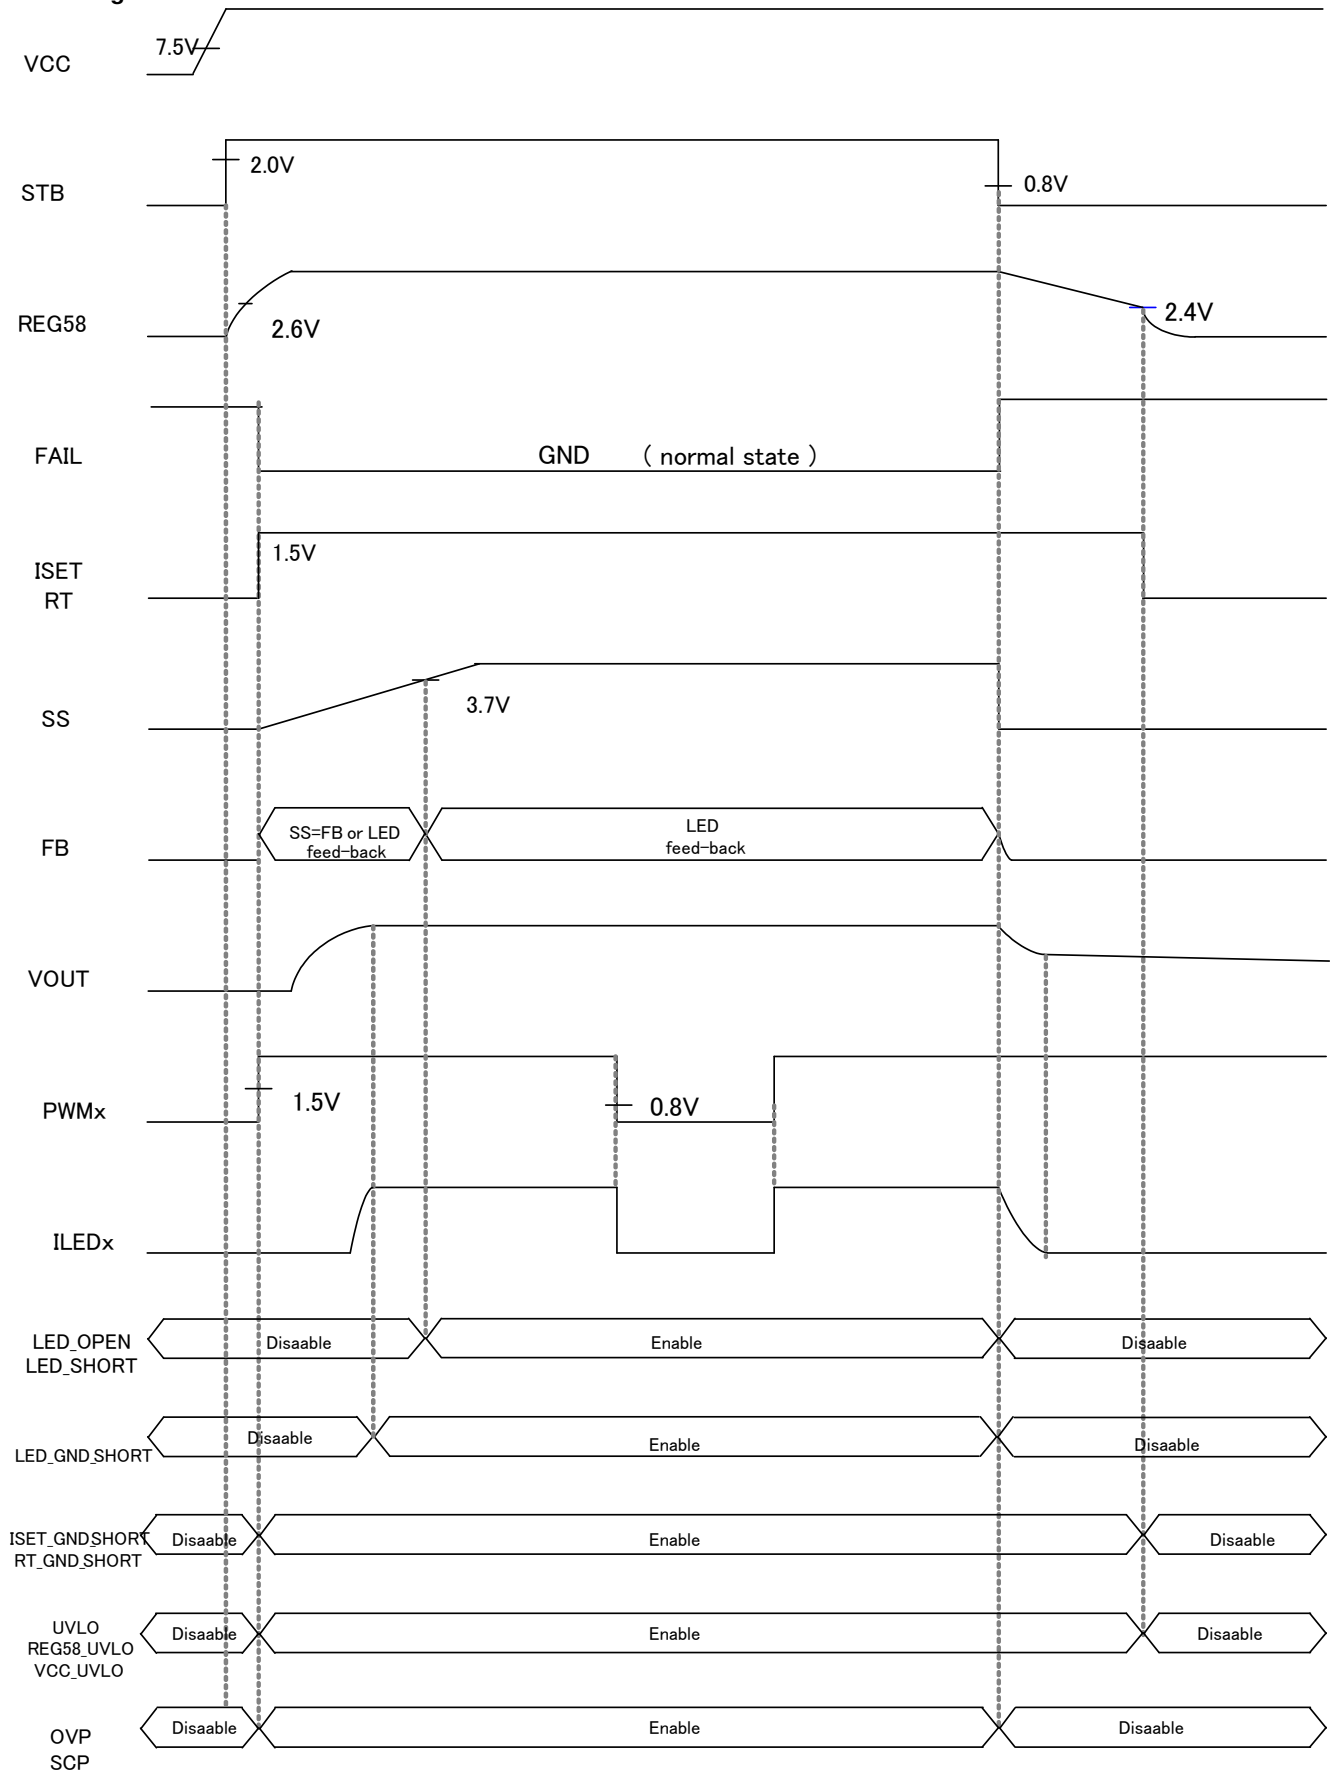

Figure 34. Timing Chart

3.4 List of Protection Functions

●List of protection detecting condition

Protection names	Detection	Detection condition			Release condition	Timer	Protection type
	pin	Detection pin condition	PWM	SS			
LED OPEN	LED x	LEDx < 0.20V	H	SS>3.7V	LEDx > 0.20V	2 <sup>16</sup> count	Latch (Only detected ch)
LEDSHORT	LED x	LEDx > 9V (LSP=OPEN)	H	SS>3.7V	LEDx < 9V (LSP=OPEN)	2 <sup>16</sup> count	Latch (Only detected ch)
LED GND SHORT	LED x	LEDx < 0.20V	H	SS>3.7V	LEDx > 0.20V	2 <sup>16</sup> + 2 <sup>7</sup> count	Latch
ISET GND SHORT	ISET	Under ISET × 90%			Canceled ISET=GND State	Immediately detect	Auto-restart
RT GND SHORT	RT	Under RT × 90%	-	-	Canceled RT=GND State	Immediately detect	Auto-restart
UVLO	UVLO	UVLO<2.7V	-	-	UVLO>3V	Immediately detect	Auto-restart
REG58 UVLO	REG58	REG58<2.4V	-	-	REG58>2.6V	Immediately detect	Auto-restart
VCC UVLO	VCC	VCC<7.2V	-	-	VCC>7.5V	Immediately detect	Auto-restart
OVP	OVP	OVP>3.0V	-	-	OVP<2.9V	2 <sup>18</sup> count	Latch
SCP	OVP	OVP<0.1V	-	-	OVP>0.1V	2 <sup>16</sup> count	Latch
OCP	CS	OCP>0.4V	-	-	-	Immediately detect	Pulse-by-Pulse

\* To clear the latch type, STB should be set to "L" once, and then to "H"

\* The count of Timer means "1count = 1 duty of switching frequency."

●List of protection detecting operation

Protection Functions	Operation when the hysteresis type protection is detected			
	DC/DC	LED Driver	Soft start	FAIL pin
LED OPEN	Continues operation	Only detected LED stops operating after CP counting	Not discharged	Open after CP counting
LEDSHORT	Continues operation	Only detected LED stops operating after CP counting	Not discharged	Open after CP counting
LED GNDSHORT	Stops operating after CP counting	Stops operating after CP counting	Discharge	Open after CP counting
ISET GND SHORT	Instantaneously stops operating	Instantaneously stops operating	Not discharged	OPEN immediately
RT GND SHORT	Instantaneously stops operating	Normal Operation	Not discharged	LOW
STB	Instantaneously stops operating	Stops (and REG58<2.4V)	Discharge	OPEN immediately
UVLO	Instantaneously stops operating	Instantaneously stops operating	Discharge	OPEN immediately
REG58 UVLO	Instantaneously stops operating	Instantaneously stops operating	Discharge	OPEN immediately
VCC UVLO	Instantaneously stops operating	Instantaneously stops operating	Discharge	OPEN immediately
OVP	Stops operating after CP counting	Stops operating after CP counting	Discharge	Open after CP counting
SCP	Stops operating after CP counting	Stops operating after CP counting	Discharge	Open after CP counting
OCP	limits duty cycle	Continues operation	Not discharged	LOW

4. Caution on use

- 1.) We pay utmost attention to the quality control of this product. However, if it exceeds the absolute maximum ratings including applied voltage and operating temperature range, it may lead to its deterioration or breakdown. Further, this makes it impossible to assume a breakdown state such as short or open circuit mode. If any special mode to exceed the absolute maximum ratings is assumed, consider adding physical safety measures such as fuses.
- 2.) Making a reverse connection of the power supply connector can cause the IC to break down. To protect the IC from breakdown due to reverse connection, take preventive measures such as inserting a diode between the external power supply and the power supply pin of the IC.
- 3.) Since current regenerated by back electromotive force flows back, take preventive measures such as inserting a capacitor between the power supply and the ground as a path of the regenerative current and fully ensure that capacitance presents no problems with characteristics such as lack of capacitance of electrolytic capacitors causes a lot of problems at low temperatures, and then determine the power supply line. Provide thermal design having an adequate margin in consideration of power dissipation (Pd) in the practical operating conditions.
- 4.) The potential of the GND pin should be maintained at the minimum level in any operating state.
- 5.) Provide thermal design having an adequate margin in consideration of power dissipation (Pd) in the practical operating conditions.

To mount the IC on a printed circuit board, pay utmost attention to the direction and displacement of the IC. Furthermore, the IC may get damaged if it is mounted in an erroneous manner or if a short circuit is established due to foreign matters entered between output pins or between output pin and power supply GND pin.

- 6.) Note that using this IC in strong magnetic field may cause it to malfunction.
- 7.) Please set the output Tr not to over absolute Maximum Ratings and ASO. CMOS IC and plural power supply IC have a possible to flow lush current momentarily. Please note VCC capacitor, VCC and GND layout.
- 8.) This IC has a built-in thermal-protection circuit (TSD circuit).  
The thermal-protection circuit (TSD circuit) is a circuit absolutely intended to protect the IC from thermal runaway, not intended to protect or guarantee the IC. Consequently, do not use the IC based on the activation of this TSD circuit for subsequent continuous use and operation of the IC.
- 9.) When testing the IC on a set board with a capacitor connected to the pin, the IC can be subjected to stress. In this case, be sure to discharge the capacitor for each process. In addition, to connect the IC to a jig up to the testing process, be sure to turn OFF the power supply prior to connection, and disconnect the jig only after turning OFF the power supply.
- 10.) This monolithic IC contains P + Isolation and P substrate layers between adjacent elements in order to keep them isolated.

P-N junctions are formed at the intersections of these P layers and the N layers of other elements, thus making up different types of parasitic elements.

For example, if a resistor and a transistor is connected with pins respectively as shown in Fig.

○When GND > (Pin A) for the resistor, or when GND > (Pin B) for the transistor (NPN), P-N junctions operate as a parasitic diode.

○When GND > (Pin B) for the transistor (NPN), the parasitic NPN transistor operates by the N layer of other element adjacent to the parasitic diode aforementioned.

Due to the structure of the IC, parasitic elements are inevitably formed depending on the relationships of potential. The operation of parasitic diodes can result in interferences in circuit operation, leading to malfunctions and eventually breakdown of the IC. Consequently, pay utmost attention not to use the IC for any applications by which the parasitic elements are operated, such as applying a voltage lower than that of GND (P substrate) to the input pin.

## Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - Installation of protection circuits or other protective devices to improve system safety
  - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - Sealing or coating our Products with resin or other coating materials
  - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

**Precautions Regarding Application Examples and External Circuits**

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

**Precaution for Electrostatic**

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

**Precaution for Storage / Transportation**

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

**Precaution for Product Label**

QR code printed on ROHM Products label is for ROHM's internal use only.

**Precaution for Disposition**

When disposing Products please dispose them properly using an authorized industry waste company.

**Precaution for Foreign Exchange and Foreign Trade act**

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

**Precaution Regarding Intellectual Property Rights**

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

**Other Precaution**

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
