## FUNCTIONAL DESCRIPTION

The XRT85L61 is an integrated BITS (Building Integrated Timing Supply) Clock Generator. Simplified block diagram of the chip is shown in Figure 1.

The XRT85L61 extracts the clock signals from the following synchronization lines:

- Balanced 100  $\Omega$  lines with 1544 kbps DS1 pattern.
- Balanced 120  $\Omega$  or unbalanced 75  $\Omega$  lines with 2048 kbps RZ pattern.
- Balanced 120  $\Omega$  or unbalanced 75  $\Omega$  line with 2048 kbps NRZ pattern.
- Balanced 110  $\Omega$  line with 64 kbps having 8 kHz violations; a “64 kHz + 8 kHz sync pattern.
- Balanced 110  $\Omega$  line with a 64 kbps pattern having both 8 kHz and 400 Hz violations; a “64 kHz + 8 kHz + 400 Hz” sync pattern.

1.1.1 64 kHz + 8 kHz Clock Extraction

The input data is shown in Figure 4. The 64 kHz clock signal consist of AMI code with 8 kHz Bipolar Violation. Both the 64 kHz and 8 kHz components are extracted from the composite received signal and presented at the 64 kHz and 8 kHz output pins.

FIGURE 4. INPUT DATA 64 KHZ + 8 KHZ OPERATION (s1 = 0, s2 = 0, s3 = 0)

1.1.2 64 kHz + 8 kHz + 400 Hz Clock Extraction

Figure 4 shows the input data for this mode. The 64 kHz clock signal consist of AMI code with 8 kHz Bipolar Violation removed every 400 Hz. The 64 kHz, 8 kHz and 400 Hz components are extracted from the composite received signal and presented at the RCik, 8 kHz and 400 Hz output pins.

**NOTE:** The inputs are not aligned with all output signals. The above diagram is used to depict the output activity when the input signals have errors.

**FIGURE 5. INPUT DATA 64 kHz + 8 kHz + 400 Hz OPERATION (s1 = 0, s2 = 0, s3 = 1)**

**NOTES:**

1. V1 and V2 indicate AMI code-rule violations, and give the 8kHz timing.
2. V1 and V2 have different violation polarity with respect to each other.
3. nV indicates no violation (violation stealing) and gives the 400 Hz timing.

**1.2 2048 kHz RZ E1 Mode**

In this mode, the XRT85L61 receives a standard E1 signal as shown in Figure 6. Table 4 gives the details of the E1 pulse.

**1.4 1544 kHz T1 Mode**

In this mode, the XRT85L61 receives a standard DS1 signal as shown in Figure 8.

**FIGURE 8. G.703 DS1 WAVE FORM**

**2.0 AIS DETECTION TIMING**

In E1 mode, AIS is set when the received incoming signal has 2 or less Zero's in a sequence of 512 bits. AIS will stay "High" for 250  $\mu$ s and AIS is cleared upon receiving three or more Zero's in the subsequent 512 bits (250 $\mu$ s) time-frame. Figure 9 shows the AIS timing.

**FIGURE 9. AIS DETECTION FOR E1 MODE**

In T1 mode, AIS is detected if the received input signal has 4 or less Zero's in a sequence of 4632 bits (3ms) and AIS is cleared when 5 or more Zero's are detected in the subsequent 4632 bits (3 ms) time-frame. Figure 10 shows the AIS timing for T1 mode.

**FIGURE 10. AIS DETECTION FOR T1 MODE**

**3.0 LOSS OF SIGNAL**

The XRT85L61 Receive Loss of Signal (RLOS) monitoring circuits consist of both analog and digital schemes. Both E1 and T1 meet G.775 RLOS declare and clear criteria. In E1 and 64kb/s modes, RLOS will be set if the input pattern exceeds 32 bit consecutive zeros. In T1 mode, RLOS will go "High" if the number of consecutive zeros exceeds 175.

The XRT85L61 RLOS detection circuit also reports RLOS if the input signal level drops below 220mVp (typical) and RLOS is cleared when the input signal level returns to more than 380mVp (typical) when the input pattern meets 12.5% density over a 32 bit period.

**TRANSFORMER RECOMENDATION**

For all applications a 1:1 transformer ratio is required. 64kbps applications require a larger Inductance transformer. Although E1 and T1 can use lower inductance transformers, Exar recommends the use of the PULSE ENGINEERING PE-65535 1:2CT transformer in a 1:1 mode by using pins 1 & 3 for the Line input and Pins 6 & 5 as the secondary input to the XRT85L61. See Figure 15 below. Smaller transformers will be evaluated in the future and recommendations will be published at that time.
