PI90LVB010

Single Bus LVDS Transceiver

Features

- Bus LVDS Signaling (BLVDS)
- Designed for Double Termination Applications
- Balanced Output Impedance
- Light Bus Loading: 5pF typical
- Glitch-free power up/down (Driver Disabled)
- Operates from a 3.3V supply
- High Signaling Rate Capability: >100Mbps
- Driver:
  - ±250mV Differential Swing into a 27Ω load
  - Propagation Delay of 1.5ns typ.
  - Low Voltage TTL (LVTTL) Inputs are 5V Tolerant
- Receiver:
  - Accepts ±50mV (min.) Differential Swing with up to 2.0V ground potential difference
  - Propagation Delay of 3.3ns typical
  - Low Voltage TTL (LVTTL) Outputs
  - Open, Short, and Terminated Fail Safe
- Bus terminal ESD exceeds 10kV
- Industrial Temperature Operation (–40°C to +85°C)
- Packaging (Pb-free & Green available):
  - 8-lead SOIC (W)
  - 8-lead MSOP (U)

Description

The PI90LVB010 is a differential line driver and receiver (transceiver) that is similar to the IEEE1596.3 SCI and ANSI/TIA/EIA-644LVDS standards, the difference is that the driver output current is higher. This modification enables true half-duplex operation with more than one LVDS driver or with two line transmission resistors over a 50Ω differential transmission line. To minimize bus loading, the driver outputs and receiver inputs are internally connected. The logic interface provides maximum flexibility resulting from four separate lines that are provided: D_{IN}, DE, $\overline{RE}$, and R_{OUT}.

This device also feature flow-through which allows easy PCB routing for short stubs between the bus pins and the connector. The driver has 10mA drive capability, allowing it to drive heavily loaded backplanes, with impedance as low as 27Ω.

The driver translates between TTL levels (single-ended) to Low Voltage Differential Signaling levels. This allows for high-speed operation, while consuming minimal power with reduced EMI. In addition the differential signaling provides common mode noise rejection of ±1V.

Absolute Maximum Ratings(1,2)

Supply Voltage (V_{CC}) 6.0V
Enable Input Voltage (DE, $\overline{RE}$).....–0.3V to (V_{CC} +0.3V)
Driver Input Voltage (DIN).....–0.3V to (V_{CC} +0.3V)
Receiver Output Voltage (R_{OUT}) .....–0.3V to (V_{CC} +0.3V)
Bus Pin Voltage (DO/RI±) ..... –0.3V to +3.9V
Driver Short Circuit ..... Continuous
ESD (HBM 1.5kΩ, 100pF)..... >10kV
Maximum Package Power Dissipation at 20°C
SOIC 1025mW
Derate SOIC Package ..... 8.2mW/°C
Storage Temperature Range .....–65°C to +150°C
Lead Temperature Range (Soldering, 4s) .....+260°C

Recommended Operating Conditions

	Min.	Max.	Units
Supply Voltage (V_{CC})	3.0	3.6	V
Receiver Input Voltage	0.0	2.9	V
Operating Free-Air Temperature	–40	+85	°C

Note:
Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.
2. All currents into device pins are positive, all currents out of device pins are negative. All voltages are referenced to ground except: V_{OD}, V_{ID}, V_{TH}, and V_{TL}, unless otherwise specified.
3. All typicals are given for V_{CC} = +3.3V or 5.0V and T_A = +25°C unless otherwise stated.
4. ESD Rating: HBM (15kΩ, 100pF) > 2.0kV EAT (0Ω, 200pF) >300V.
5. C_L includes probe and jig capacitance.
6. Generator waveforms for all tests unless otherwise specified: f = 1MHz, ZO = 50Ω, t_r, $t_f \leq$ 6.0ns (0% - 100%) on control pins and ≤ 1.0ns for R_I inputs.
7. The PI90LVB010 is a current mode device and only functions with datasheet specification when a resistive load is appplied between the driver outputs.
8. For receiver disable delays, the switch is set to V_{CC} for t_{PZL}, and t_{PLZ} and to GND for t_{PZH} and t_{PHZ}.
