Description

The AP2281 slew rate controlled load switch is a single P-channel MOSFET power switch designed for high-side load-switching applications. The MOSFET has a typical $R_{DS(ON)}$ of 80mΩ at 5V, allowing increased load current handling capacity with a low forward voltage drop. The turn-on slew rate of the device is controlled internally.

The AP2281 load switch is designed to operate from 1.5V to 6V, making it ideal for 1.8V, 2.5V, 3.3V, and 5V systems. The typical quiescent supply current is only 0.01μA.

Features

- Wide input voltage range: 1.5V – 6V
- Low $R_{DS(ON)}$: 80mΩ typical @ 5V
- Turn-on slew rate controlled
- AP2281-1: 1ms turn-on rise time
- AP2281-3: 100μs turn-on rise time with internal discharge
- Very low turn-on quiescent current: << 1μA
- Fast load discharge option
- Temperature range -40°C to +85°C
- **Lead-Free Finish; RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Applications

- Smart Phones
- PDA
- Cell Phones
- GPS Navigators
- PMP/MP4
- Notebook and Pocket PC

Pin Descriptions

Pin Name	Pin Number		Function
	SOT26	U-DFN2018-6	
OUT	1	5, 6	Voltage output pin. This is the pin to the P-channel MOSFET drain connection. Bypass to ground through a 0.1uF capacitor.
GND	2, 5	4	Ground.
EN	3	3	Enable input, active high
IN	4, 6	1, 2	Voltage input pin. This is the pin to the P-channel MOSFET source. Bypass to ground through a 1µF capacitor.
PAD		7	Thermal pad. Suggest connecting to ground plane to get better heat dissipation.

Application Notes

Input Capacitor

A 1μF capacitor is recommended to connect between IN and GND pins to decouple input power supply glitch and noise. The input capacitor has no specific type or ESR (Equivalent Series Resistance) requirement. However, for higher current application, ceramic capacitors are recommended due to their capability to withstand input current surges from low impedance sources, such as batteries in portable applications. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both IN and GND.

Output Capacitor

A 0.1μF capacitor is recommended to connect between OUT and GND pins to stabilize and accommodate load transient condition. The output capacitor has no specific type or ESR requirement. The amount of the capacitance may be increased without limit. For PCB layout, the output capacitor must be placed as close as possible to OUT and GND pins, and keep the traces as short as possible.

ENABLE/SHUTDOWN Operation

The AP2281 is turned on by setting the EN pin high, and is turned off by pulling it low. To ensure proper operation, the signal source used to drive the EN pin must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics section under V_{IL} and V_{IH}.

DISCHARGE Operation

The AP2281-3 offers discharge option that helps to discharge the output charge when disabled.

Power Dissipation

The device power dissipation and proper sizing of the thermal plane is critical to avoid thermal shutdown and ensure reliable operation. Power dissipation of the device depends on input voltage and load conditions and can be calculated by:

$$P_D = I_{OUT}^2 x R_{DSON} \qquad \textbf{(1)}$$

However, the maximum power dissipation that can be handled by the device depends on the maximum junction to ambient thermal resistance, maximum ambient temperature, and maximum device junction temperature, which can be approximated by the equation below:

$$P_D(max@T_A) = \frac{(+125°C - T_A)}{\theta_{JA}} \qquad \textbf{(2)}$$

For example at V_{IN} = 5V, the typical R_{DSON} = 80mΩ. For I_{OUT} = 2A, the maximum power dissipation calculated using equation (1) is P_D = 0.32W. Based on SOT26 θ_{JA} = 153°C/W and equation (2), the calculated junction temperature rise from ambient is approximately 49°C. Since the maximum junction temperature is 125°C, the operating ambient temperature must be kept below 76°C to safely operate the device.

Application Notes (cont.)

On the other hand, at T_A = +85°C and V_{IN} = 5V, the calculated maximum power dissipation from equation (2) is approximately $P_{D(MAX)}$ = 0.26W. Hence the safe operating maximum continuous current is 1.81A. For other application conditions, the users should recalculate the device maximum power dissipation based on the operating conditions.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
