

Triple, 675MHz, Low Power, Video Operational Amplifier

The HFA1305 is a triple, high speed, low power current feedback amplifier built with Intersil's proprietary complementary bipolar UHF-1 process.

These amplifiers deliver up to 675MHz bandwidth and 2500V/ μ s slew rate, on only 58mW of quiescent power. They are specifically designed to meet the performance, power, and cost requirements of high volume video applications. The excellent gain flatness and differential gain/phase performance make these amplifiers well suited for component or composite video applications. Video performance is maintained even when driving a double terminated cable ($R_L = 150\Omega$), and degrades only slightly when driving two double terminated cables ($R_L = 75\Omega$). RGB applications will benefit from the high slew rates, and high full power bandwidth.

The HFA1305 is a pin compatible, low power, high performance upgrade for the popular Intersil HA5013, and for the AD8073 and CLC5623, in $\pm 5V$ applications.

Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE	PKG. NO.
HFA1305IB	-40 to 85	14 Ld SOIC	M14.15
HFA1305IA	-40 to 85	16 Ld SSOP	M16.15A
HA5025EVAL (Note)	High Speed Op Amp SOIC Evaluation Board		
OPAMPSSOPEVAL1	High Speed Op Amp SSOP Evaluation Board		

NOTE: Requires a SOIC-to-DIP adapter. See "Evaluation Board" section inside.

Features

- Low Supply Current 5.8mA/Op Amp
- High Input Impedance 1M Ω
- Wide -3dB Bandwidth ($A_V = +2$) 675MHz
- Very Fast Slew Rate 2500V/ μ s
- Gain Flatness (to 50MHz) ± 0.03 dB
- Differential Gain 0.02%
- Differential Phase 0.03 Degrees
- All Hostile Crosstalk (5MHz) -64dB
- Pin Compatible Upgrade to HA5013, AD8073 and CLC5623 in $\pm 5V$ Supply Applications.

Applications

- Flash A/D Drivers
- Professional Video Processing
- Video Digitizing Boards/Systems
- Computer Video Plug-In Boards
- RGB Preamps
- Medical Imaging
- Hand Held and Miniaturized RF Equipment
- Battery Powered Communications
- High Speed Oscilloscopes and Analyzers

Human Body Model (Per MIL-STD-883 Method 3015.7) ...	600V

Operating Conditions

Temperature Range -40°C to 85°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

- θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- Output is short circuit protected to ground. Brief short circuits to ground will not degrade reliability, however continuous (100% duty cycle) output current must not exceed 30mA for maximum reliability.

NOTES:

- The optimum feedback resistor depends on closed loop gain and package type. See the "Optimum Feedback Resistor" table in the Application Information section for details.
- Test Level: A. Production Tested; B. Typical or Guaranteed Limit Based on Characterization; C. Design Typical for Information Only.
- See Typical Performance Curves for more information.
- Undershoot dominates for output signal swings below GND (e.g., $2V_{P-P}$), yielding a higher overshoot limit compared to the $V_{OUT} = 0V$ to $2V$ condition. See the "Application Information" section for details.

Application Information

Performance Differences Between SOIC and SSOP

The amplifiers comprising the HFA1305 are high frequency current feedback amplifiers. As such, they are sensitive to feedback capacitance which destabilizes the op amp and causes overshoot and peaking. Unfortunately, the standard triple op amp pinout places the amplifier's output next to its inverting input, thus making the package capacitance an unavoidable parasitic feedback capacitor. The larger parasitic capacitance of the SSOP requires a larger feedback resistor to stabilize the amplifier, yielding an SSOP device with different performance characteristics than the SOIC device - see Electrical Specification tables for details.

Because of these performance differences, designers should evaluate and breadboard with the same package style to be used in production.

Note that the "Typical Performance Curves" section has separate pulse and frequency response graphs for each package type. Graphs not labeled with a specific package type are applicable to both packages.

Optimum Feedback Resistor

Although a current feedback amplifier's bandwidth dependency on closed loop gain isn't as severe as that of a voltage feedback amplifier, there can be an appreciable decrease in bandwidth at higher gains. This decrease may be minimized by taking advantage of the current feedback amplifier's unique relationship between bandwidth and R_F . All current feedback amplifiers require a feedback resistor, even for unity gain applications, and R_F , in conjunction with the internal compensation capacitor, sets the dominant pole of the frequency response. Thus, the amplifier's bandwidth is inversely proportional to R_F . The HFA1305 design is optimized for $R_F = 510\Omega/681\Omega$ (SOIC/SSOP) at a gain of +2. Decreasing R_F decreases stability, resulting in excessive peaking and overshoot (Note: Capacitive feedback causes the same problems due to the feedback impedance decrease at higher frequencies). However, at higher gains the amplifier is more stable so R_F can be decreased in a trade-off of stability for bandwidth.

The table below lists recommended R_F values for various gains, and the expected bandwidth. For good channel-to-channel gain matching, it is recommended that all resistors (termination as well as gain setting) be $\pm 1\%$ tolerance or better.

OPTIMUM FEEDBACK RESISTOR

GAIN (A_{CL})	R_F (Ω) SOIC/SSOP	BANDWIDTH (MHz) SOIC/SSOP
-1	360/432	420/450
+1	464 (+ $R_S = 649$)/ 681 (+ $R_S = 806$)	375/330
+2	510/681	560/675
+5	200/649	330/200
+10	180/681	140/120

Non-inverting Input Source Impedance

For best operation, the DC source impedance seen by the non-inverting input should be $\geq 50\Omega$. This is especially important in inverting gain configurations where the non-inverting input would normally be connected directly to GND.

Pulse Undershoot

The HFA1305 utilizes a quasi-complementary output stage to achieve high output current while minimizing quiescent supply current. In this approach, a composite device replaces the traditional PNP pulldown transistor. The composite device switches modes after crossing 0V, resulting in added distortion for signals swinging below ground, and an increased undershoot on the negative portion of the output waveform (see Figure 8). This undershoot isn't present for small bipolar signals, or large positive signals (see Figure 6 and Figure 7).

PC Board Layout

The frequency response of this amplifier depends greatly on the amount of care taken in designing the PC board. **The use of low inductance components such as chip resistors and chip capacitors is strongly recommended, while a solid ground plane is a must!**

Attention should be given to decoupling the power supplies. A large value (10 μ F) tantalum in parallel with a small value (0.1 μ F) chip capacitor works well in most cases.

Terminated microstrip signal lines are recommended at the input and output of the device. Capacitance, parasitic or planned, connected to the output must be minimized, or isolated as discussed in the next section.

Care must also be taken to minimize the capacitance to ground at the amplifier's inverting input (-IN). The larger this capacitance, the worse the gain peaking, resulting in pulse overshoot and eventual instability. To reduce this capacitance the designer should remove the ground plane under traces connected to -IN, and keep connections to -IN as short as possible.

An example of a good high frequency layout is the Evaluation Boards shown in Figures 3 and 5.

Driving Capacitive Loads

Capacitive loads, such as an A/D input, or an improperly terminated transmission line will degrade the amplifier's phase margin resulting in frequency response peaking and possible oscillations. In most cases, the oscillation can be avoided by placing a resistor (R_S) in series with the output prior to the capacitance.

Figure 1 details starting points for the selection of this resistor. The points on the curve indicate the R_S and C_L combinations for the optimum bandwidth, stability, and settling time, but experimental fine tuning is recommended. Picking a point above or to the right of the curve yields an overdamped response, while points below or left of the curve indicate areas of underdamped performance.

R_S and C_L form a low pass network at the output, thus limiting system bandwidth well below the amplifier bandwidth of 560MHz. By decreasing R_S as C_L increases (as illustrated in the curve), the maximum bandwidth is obtained without sacrificing stability. In spite of this, bandwidth still decreases as the load capacitance increases.

FIGURE 1. RECOMMENDED SERIES OUTPUT RESISTOR vs LOAD CAPACITANCE

Evaluation Board

The performance of the HFA1305IB (SOIC) may be evaluated using the HA5025 Evaluation Board and a SOIC to DIP adaptor like the Aries Electronics Part Number 14-350000-10. The SSOP version can be evaluated using the OPAMPSSOPEVAL board.

The schematic for the SOIC amplifier 1 and the HA5025EVAL board layout are shown in Figure 2 and Figure 3. Resistors R_F , R_G , and $+R_S$ may require a change to values applicable to the HFA1305IB.

The schematic for the SSOP amplifier 1 and the OPAMPSSOPEVAL board layout are shown in Figure 4 and Figure 5. Resistors R_F , R_G , and $+R_S$ may require a change to values applicable to the HFA1305IA.

To order evaluation boards (part number HA5025EVAL or OPAMPSSOPEVAL), please contact your local sales office.

N	14		14		7
alpha	0°	8°	0°	8°	-

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

Shrink Small Outline Plastic Packages (SSOP)

NOTES:

- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
- The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "B" does not include dambar protrusion. Allowable dambar protrusion shall be 0.10mm (0.004 inch) total in excess of "B" dimension at maximum material condition.
- Controlling dimension: INCHES. Converted millimeter dimensions are not necessarily exact.
