

- Integrated 0.15-Ω Power MOSFET
- 7-V to 15-V Operation
- Digital-Programmable Current Limit from 0 A to 3 A
- 100-μA  $I_{CC}$  When Disabled
- Programmable On Time
- Programmable Start Delay
- Fixed 2% Duty Cycle
- Thermal Shutdown
- Fault-Output Indicator
- Maximum-Output Current Can Be Set to 1 A Above the Programmed-Fault Level or to a Full 4 A
- Power SOIC and TSSOP, Low Thermal Resistance Packaging

## description

The UCC3915 programmable hot swap power manager provides complete power-management, hot-swap capability, and circuit breaker functions. The only external component required to operate the device, other than power supply bypassing, is the fault-timing capacitor,  $C_T$ . All control and housekeeping functions are integrated, and externally programmable. These include the fault current level, maximum output sourcing current, maximum fault time, and startup delay. In the event of a constant fault, the internal fixed 2% duty cycle ratio limits average output power.

The internal 4-bit DAC allows programming of the fault-level current from 0 A to 3 A with 0.25-A resolution. The IMAX control pin sets the maximum-sourcing current to 1 A above the trip level or to a full 4 A of output current for fast output capacitor charging. (continued)

## block diagram

UDG-99174

NOTE: Pin numbers refer to DIL-16 and SOIC-16 packages.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

SLUS198C – FEBRUARY 2000 - REVISED - JUNE 2001

## description (continued)

When the output current is below the fault level, the output MOSFET is switched on with a nominal ON resistance of 0.15  $\Omega$ . When the output current exceeds the fault level, but is less than the maximum-sourcing level, the output remains switched on, but the fault timer starts, charging CT. Once CT charges to a preset threshold, the switch is turned off, and remains off for 50 times the programmed fault time. When the output current reaches the maximum sourcing level, the MOSFET transitions from a switch to a constant current source.

The UCC3915 can be put into sleep mode, drawing only 100  $\mu$ A of supply current. Other features include an open-drain fault-output indicator, thermal shutdown, undervoltage lockout, 7-V to 15-V operation, and low-thermal resistance SOIC and TSSOP power packages.

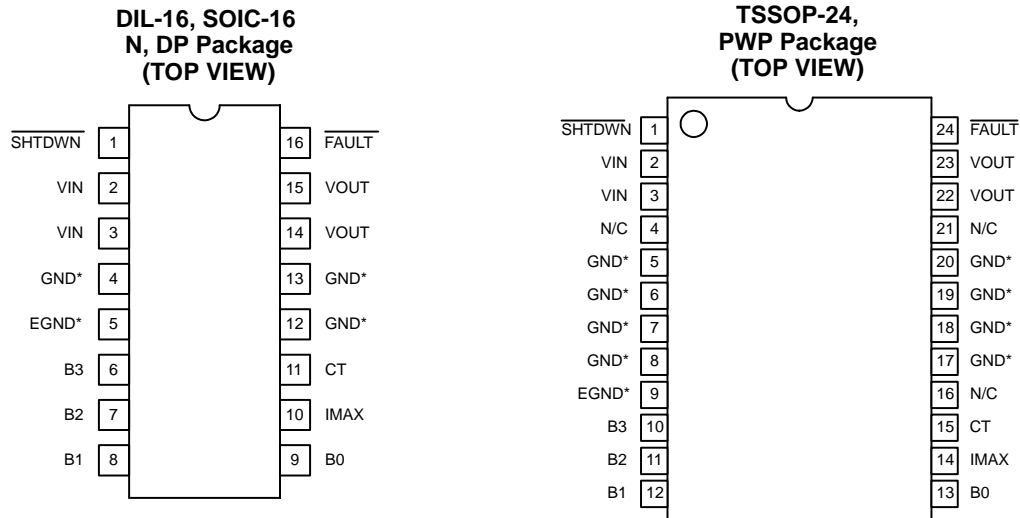

## absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

VIN	15.5 V
VOUT – VIN	.0.3 V
FAULT sink current	50 mA
FAULT voltage	–0.3 V to 8 V
Output current	Self limiting
TTL input voltage	–0.3 to VIN
Storage temperature, T <sub>stg</sub>	–65°C to 150°C
Junction temperature, T <sub>J</sub>	–55°C to 150°C
Lead temperature (soldering, 10 sec.)	300°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

‡ Currents are positive into, negative out of the specified terminal. Consult Packaging Section of the *Interface Products Data Book* (TI Literature Number SLUD002) for thermal limitations and considerations of packages.

## package information

\*Pin 5 serves as lowest impedance to the electrical ground; Pins 4, 12, and 13 serve as heat sink/ground. These pins should be connected to large etch areas to help dissipate heat. For N Package, pins 4, 12, and 13 are N/C.

\*Pin 9 serves as lowest impedance to the electrical ground; other GND pins serve as heat sink/ground. These pins should be connected to large etch areas to help dissipate heat.

TTL input low current	$V_{IL} = 0.4\text{ V}$			1	$\mu\text{A}$

NOTE 1: All voltages are with respect to GND. Current is positive into and negative out of the specified terminal.

# UCC2915, UCC3915 15-V PROGRAMMABLE HOT SWAP POWER MANAGER

SLUS198C – FEBRUARY 2000 - REVISED - JUNE 2001

## pin descriptions

**B0 – B3:** These pins provide digital input to the DAC, which sets the fault-current threshold. They can be used to provide a digital soft-start and adaptive-current limiting.

**CT:** A capacitor connected to ground sets the maximum-fault time. The maximum-fault time must be more than the time required to charge the external capacitance in one cycle. The maximum-fault time is defined as  $T_{\text{FAULT}} = 16.1 \times 10^3 \times C_T$ . Once the fault time is reached the output will shutdown for a time given by  $T_{\text{SD}} = 833 \times 10^3 \times C_T$ , this equates to a 1.9% duty cycle.

**FAULT:** Open-drain output, which pulls low upon any fault or interrupt condition, or thermal shutdown.

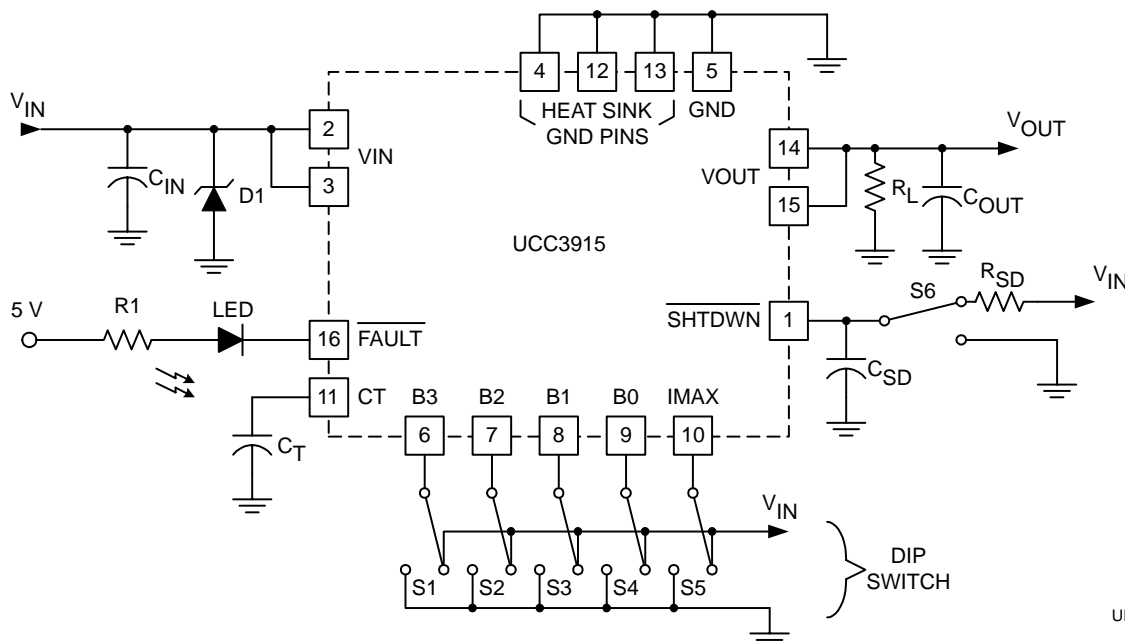

**IMAX:** When this pin is set to a logic low, the maximum-sourcing current will always be 1 A above the programmed-fault level. When set to a logic high, the maximum-sourcing current will be a constant 4 A for applications which require fast charging of load capacitance.

**SHTDWN:** When this pin is brought to a logic low, the IC is put into a sleep mode drawing typically less than  $100 \mu\text{A}$  of  $I_{\text{CC}}$ . The input threshold is hysteretic, allowing the user to program a startup delay with an external RC circuit.

**VIN:** Input voltage to the UCC3915. The recommended voltage range is 7 V to 15 V. Both VIN pins should be connected together and connected to the power source.

**VOUT:** Output voltage from the UCC3915. Both VOUT pins should be connected together and connected to the load. When switched the output voltage will be approximately  $V_{\text{IN}} - (0.15 \Omega \times I_{\text{OUT}})$ . VOUT must not exceed VIN by greater than 0.3 V.

## APPLICATION INFORMATION

UDG-99175

Figure 1. Evaluation Circuit

# UCC2915, UCC3915 15-V PROGRAMMABLE HOT SWAP POWER MANAGER

SLUS198C – FEBRUARY 2000 - REVISED - JUNE 2001

## APPLICATION INFORMATION

### protecting the UCC3915 from voltage transients

The parasitic inductance associated with the power distribution can cause a voltage spike at  $V_{IN}$  if the load current is suddenly interrupted by the UCC3915. It is important to limit the peak of this spike to less than 15 V to prevent damage to the UCC3915. This voltage spike can be minimized by:

- Reducing the power distribution inductance (e.g., twist the positive (+) and negative (-) leads of the power supply feeding  $V_{IN}$ , locate the power supply close to the UCC3915 or use PCB power and ground planes).
- Decoupling  $V_{IN}$  with a capacitor,  $C_{IN}$  (refer to Figure 1), located close to the  $V_{IN}$  pins. This capacitor is typically 1  $\mu$ F or less to limit the inrush current.
- Clamping the voltage at  $V_{IN}$  below 15 V with a Zener diode, D1 (refer to Figure 1), located close to the  $V_{IN}$  pins.

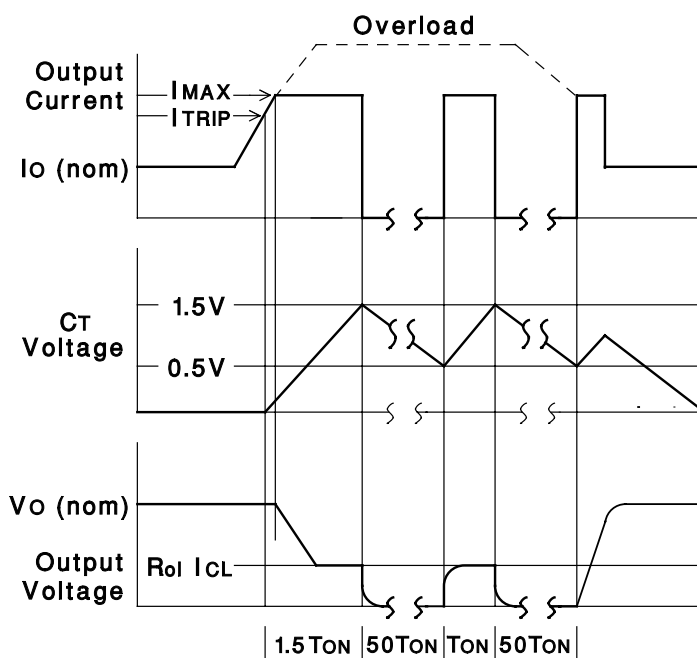

Figure 2. Load Current, Timing-Capacitor Voltage, and Output Voltage of the UCC3915 Under Fault Conditions

### estimating maximum load capacitance

For hot-swap applications, the rate at which the total output capacitance can be charged depends on the maximum-output current available and the nature of the load. For a constant-current, current-limited application, the output will come up if the load asks for less than the maximum available short-circuit current.

To ensure recovery of a duty cycle from a short-circuited load condition, there is a maximum total output capacitance which can be charged for a given unit on time (fault time). The design value of on or fault time can be adjusted by changing the timing capacitor  $C_T$ .

### APPLICATION INFORMATION

For worst-case constant-current load of value just less than the trip limit;  $C_{OUT(max)}$  can be estimated from:

$$C_{OUT(max)} \approx (I_{MAX} - I_{LOAD}) \times \left( \frac{16.1 \times 10^3 \times C_T}{V_{OUT}} \right)$$

Where  $V_{OUT}$  is the output voltage.

For a resistive load of value  $R_L$ , the value of  $C_{OUT(max)}$  can be estimated from:

$$C_{OUT(max)} \approx \left[ \frac{16.1 \times 10^3 \times C_T}{R_L \times \ln \left[ \frac{1}{1 - \frac{V_{OUT}}{I_{MAX} \times R_L}} \right]} \right]$$

Long  $C_T$  times must consider the maximum temperature. Thermal shutdown protection may be the limiting fault time.

#### **safety recommendations**

Although the UCC3915 is designed to provide system protection for all fault conditions, all integrated circuits can ultimately fail short. For this reason, if the UCC3915 is intended for use in safety-critical applications where UL or some other safety rating is required, a redundant safety device such as a fuse should be placed in series with the device. The UCC3915 will prevent the fuse from blowing for virtually all fault conditions, increasing system reliability and reducing maintenance cost, in addition to providing the hot-swap benefits of the device.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

UCC3915DPTR	ACTIVE	SOIC	D	16	2500	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	0 to 70	UCC3915DP	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
