PCM3070EVM-K Evaluation Module

This user's guide describes the characteristics, operation, and use of the PCM3070EVM-K. This evaluation module (EVM) features a complete stereo audio codec with several inputs and outputs, extensive audio routing, mixing, and effects capabilities. A complete circuit description, schematic diagram, and bill of materials are also included.

Contents

List of Figures

List of Tables

1 EVM Overview

1.1 Features

- Full-featured evaluation board for the PCM3070 stereo audio codec
- USB connection to personal computer (PC) provides power, control, and streaming audio data for easy evaluation
- Onboard microphone for ADC evaluation
- Connection points for external control and digital audio signals for quick connection to other circuits/input devices

The PCM3070EVM-K is a complete evaluation kit, which includes a universal serial bus (USB)-based motherboard and evaluation software for use with a personal computer running the Microsoft Windows® operating system (Windows Win2000 or Windows XP).

1.2 Introduction

The PCM3070EVM is in the Texas Instruments (TI) modular EVM form factor, which allows direct evaluation of the device performance and operating characteristics and eases software development and system prototyping.

The PCM3070EVM-K is a complete evaluation/demonstration kit, which includes a USB-based motherboard called the USB-MODEVM Interface board and evaluation software for use with a PC running the Microsoft Windows operating systems.

The PCM3070EVM-K is operational with one USB cable connection to a PC. The USB connection provides power, control, and streaming audio data to the EVM for reduced setup and configuration. The EVM also allows external control signals, audio data, and power for advanced operation, which allows prototyping and connection to the rest of the development or system evaluation.

2 EVM Description and Basics

This section provides information on the analog input and output, digital control, power, and general connection of the PCM3070EVM-K .

2.1 PCM3070EVM-K Block Diagram

The PCM3070EVM-K consists of two separate circuit boards, the USB-MODEVM and the PCM3070EVM. The USB-MODEVM is built around the TAS1020B streaming audio USB controller with an 8051-based core. The motherboard features two positions for modular EVMs, or one double-wide serial modular EVM can be installed. The PCM3070EVM is one of the double-wide modular EVMs that is designed to work with the USB-MODEVM.

The simple diagram of Figure 1 shows how the PCM3070EVM is connected to the USB-MODEVM. The USB-MODEVM Interface board is intended to be used in USB mode, where control of the installed EVM is accomplished using the onboard USB controller device. Provision is made, however, for driving all the data buses (I^2C™, SPI™, I^2S, etc.) externally. The source of these signals is controlled by SW2 on the USB-MODEVM. See Table 1 for details on the switch settings.

The USB-MODEVM has two EVM positions that allow for the connection of two small evaluation modules or one larger evaluation module. The PCM3070EVM is designed to fit over both of the smaller evaluation module slots as shown in Figure 1

2.1.1 USB-MODEVM Interface Board

The diagram of Figure 1 shows only the basic features of the USB-MODEVM Interface board.

Because the PCM3070EVM is a double-wide modular EVM, it is installed with connections to both EVM positions, which connects the PCM3070 digital control interface to the I^2C port realized using the TAS1020B, as well as the TAS1020B digital audio interface.

In the factory configuration, the board is ready to be used with the USB-MODEVM. To view all the functions and configuration options available on the USB-MODEVM board, see the USB-MODEVM Interface Board schematic in Appendix F.

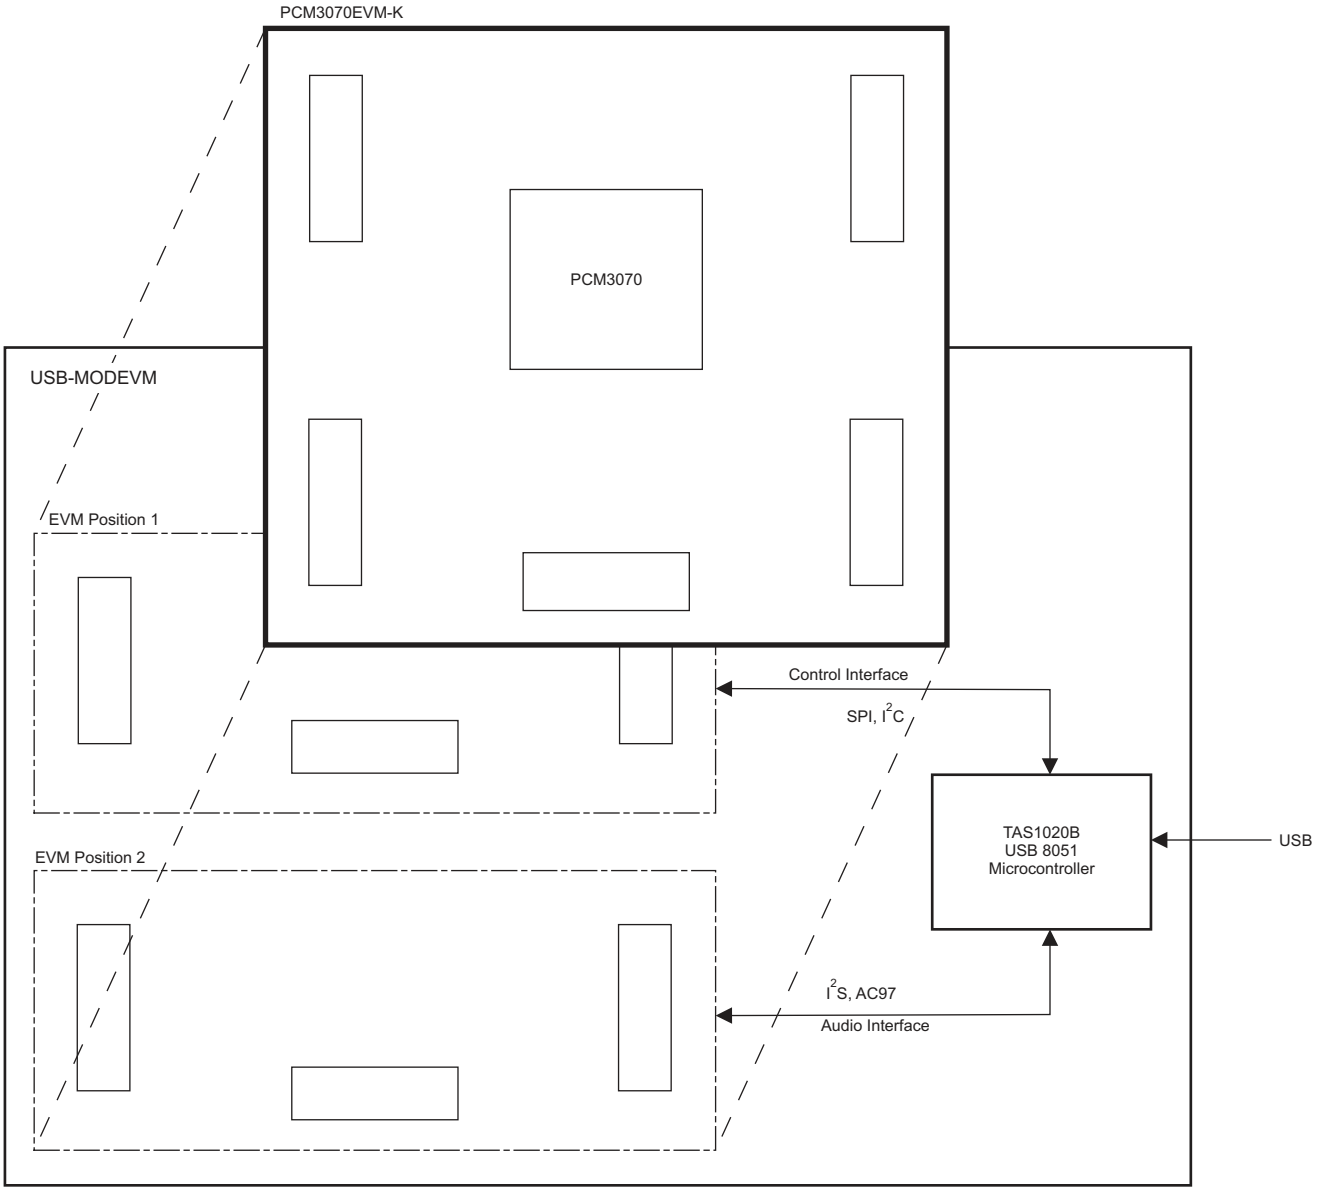

Figure 1. PCM3070EVM-K Block Diagram

2.2 Default Configuration and Connections

2.2.1 USB-MODEVM

Table 1 provides a list of the SW2 settings on the USB-MODEVM. For use with the PCM3070EVM, SW-2 positions 1, 3, 4, 5, 6, and 7 must be set to ON, whereas SW-2.2 and SW-2.8 must be set to OFF. If the PCM3070EVM is to be used with an external audio interface, SW2.4 and SW2.5 also need to be set to OFF and such interface must be connected as explained in Section 2.4

Table 1. USB-MODEVM SW2 Settings

SW-2 Switch Number	Label	Switch Description
1	A0	USB-MODEVM EEPROM I^{2}C Address A0 ON: A0 = 0 OFF: A0 = 1
2	A1	USB-MODEVM EEPROM I^{2}C Address A1 ON: A1 = 0 OFF: A1 = 1
3	A2	USB-MODEVM EEPROM I^{2}C Address A2 ON: A2 = 0 OFF: A2 = 1
4	USB I^{2}S	I^{2}S Bus Source Selection ON: I^{2}S Bus connects to TAS1020 OFF: I^{2}S Bus connects to USB-MODEVM J14
5	USB MCK	I^{2}S Bus MCLK Source Selection ON: MCLK connects to TAS1020 OFF: MCLK connects to USB-MODEVM J14
6	USB SPI	SPI Bus Source Selection ON: SPI Bus connects to TAS1020 OFF: SPI Bus connects to USB-MODEVM J15
7	USB RST	RST Source Selection ON: EVM Reset Signal comes from TAS1020 OFF: EVM Reset Signal comes from USB-MODEVM J15
8	EXT MCK	External MCLK Selection ON: MCLK Signal is provided from USB-MODEVM J10 OFF: MCLK Signal comes from either selection of SW2-5

2.2.2 PCM3070 Jumper Locations

Table 2 provides a list of jumpers found on the EVM and their factory default conditions.

Table 2. List of Jumpers and Switches

Jumper	Default Position	Jumper Description
W1	Removed	Connects an external microphone bias.
W2	Removed	Onboard microphone connect (-).
W3	Removed	Onboard microphone connect (+).
W4	Removed	Connects bias resistor to IN3_R.
W5	Removed	Connects bias resistor to IN3_L.
W6	Removed	Provides means to change effective resistance to 1 kΩ for differential microphone.
W7	Installed	Connects IN3_R to J5/microphone.
W8	Removed	Connects IN3_R to GND or 1-kΩ pulldown.
W9	Removed	Connects 16-Ω load to HPL
W10	Removed	Connects 16-Ω load to HPR
W11	Removed	DC-couples HPL to its output. Use when driving differentially.
W12	Removed	DC-couples HPR to its output. Use when driving differentially.
W13	Installed	Selects the onboard EEPROM as the TAS1020B firmware source.

Table 2. List of Jumpers and Switches (continued)

Jumper	Default Position	Jumper Description
W14	Installed	Connects SCLK for USB SPI.
W15	Installed	Connects $\overline{\text{RESET}}$ for USB RESET.
W16	Installed	Provides a means to measure IOVDD current.
W17	Installed	Provides a means to measure DVDD current.
W18	Installed	Provides a means to measure LDO in/HPVDD current.
W19	Installed	Provides a means to measure AVDD current.
W20	2-3	Selects LDOin/HPVDD +5-V regulator source.
W21	Installed	Connects IOVDD from the header block to the rest of the circuit.
W22	Removed	DC-couples IN2_L. Use when evaluating DC measurement feature for this pin.
W23	Removed	DC-couples IN2_R. Use when evaluating DC measurement feature for this pin.
SW1	I2C	When set to I2C, the I2C signals from P12/J12 are connected to the codec and SPI_SELECT is set low. When set to SPI, the SPI signals from P12/J12 are connected to the codec and SPI_SELECT is pulled to IOVDD.
SW2	LOW	When set to LOW, AVDD and DVDD are connected to +1.8 VA and +1.8 VD, respectively, and LDO_SELECT is set low. When set to HI, AVDD, and DVDD are disconnected from other supplies and LDO_SELECT is pulled to IOVDD.

2.3 Analog Signal Connections

2.3.1 Analog Inputs

The analog input sources can be applied directly to terminal blocks J2, J3, and J4 or input jacks J1 and J5. The connection details can be found in Appendix A.

2.3.2 Analog Output

The analog outputs are available from terminal blocks J6 and J8 or output jacks J7, J9, and J10. Note that J10 is provided for signal-to-noise ratio (SNR) measurements only. The connection details can be found in Appendix A.

2.4 Digital Signal Connections

The digital inputs and outputs of the EVM can be monitored through P12 and P22. If external signals need to be connected to the EVM, digital inputs must be connected via J14 and J15 on the USB-MODEVM and the SW2 switch must be changed accordingly (see Section 2.2.1). The connector details are available in Section A.2.

2.5 Power Connections

The PCM3070EVM can be powered independently when being used in stand-alone operation or by the USB-MODEVM when it is plugged onto the motherboard.

2.5.1 Stand-Alone Operation

When used as a stand-alone EVM, power is applied to P23/J23 directly; make sure to reference the supplies to the appropriate grounds on that connector.

CAUTION

Verify that all power supplies are within the safe operating limits shown on the PCM3070 data sheet before applying power to the EVM.

P23/J23 provides connection to the common power bus for the PCM3070EVM. Power is supplied on the pins listed in Table 6.

The PCM3070EVM-K motherboard (the USB-MODEVM Interface board) supplies power to P23/J23 of the PCM3070EVM. Power for the motherboard is supplied either through its USB connection or via terminal blocks on that board.

2.5.2 USB-MODEVM Operation

The USB-MODEVM Interface board can be powered from several different sources:

- USB
- 6-Vdc to 10-Vdc ac/dc external wall supply (not included)
- Laboratory power supply

When powered from the USB connection, JMP6 must have a shunt from pins 1–2 (this is the default factory configuration). When powered from 6-Vdc to 10-Vdc power supply, either through the J8 terminal block or J9 barrel jack, JMP6 must have a shunt installed on pins 2–3. If power is applied in any of these ways, onboard regulators generate the required supply voltages, and no further power supplies are necessary.

If laboratory supplies are used to provide the individual voltages required by the USB-MODEVM Interface, JMP6 must have no shunt installed. Voltages are then applied to J2 (+5VA), J3 (+5VD), J4 (+1.8VD), and J5 (+3.3VD). The +1.8VD and +3.3VD can also be generated on the board by the onboard regulators from the +5VD supply; to enable this configuration, the switches on SW1 need to be set to enable the regulators by placing them in the ON position (lower position, looking at the board with text reading right-side up). If +1.8VD and +3.3VD are supplied externally, disable the onboard regulators by placing SW1 switches in the OFF position.

Each power supply voltage has an LED (D1-D7) that illuminates when the power supplies are active.

3 PCM3070EVM-K Setup and Installation

The following section provides information on using the PCM3070EVM-K, including setup, program installation, and program usage.

NOTE: If using the EVM in stand-alone mode, the software must be installed per the following instructions, but the hardware configuration may be different.

3.1 Software Installation

1. Download the latest version of the PCM3070 Control Software (CS) located in the http://focus.ti.com/docs/toolsw/folders/print/pcm3070evm-k.html.
2. Open the self-extracting installation file.
3. Extract the software to a known folder.
4. Install the EVM software by double-clicking the **Setup** executable, and follow the directions. The user may be prompted to restart their computer.

This installs all the PCM3070EVM-K software and required drivers onto the PC.

3.2 EVM Connections

1. Ensure that the PCM3070EVM is installed on the USB-MODEVM Interface board, aligning J11, J12, J21, J22, and J23 with the corresponding connectors on the USB-MODEVM.
2. Verify that the jumpers and switches are in their default conditions.
3. Attach a USB cable from the PC to the USB-MODEVM Interface board. The default configuration provides power, control signals, and streaming audio via the USB interface from the PC. On the USB-MODEVM, LEDs D3, D4, D5, and D7 illuminate to indicate that the USB is supplying power.
4. For the first connection, the PC recognizes new hardware and begins an initialization process. The user may be prompted to identify the location of the drivers or allow the PC to automatically search for them. Allow the automatic detection option.
5. Once the PC confirms that the hardware is operational, D2 on the USB-MODEVM illuminates to indicate that the firmware has been loaded and the EVM is ready for use. If D2 does not illuminate, verify that the EEPROM jumper and switch settings conform to Table 1 and Table 2.

After the PCM3070EVM-K software installation (described in Section 3.2) is complete, evaluation and development with the PCM3070 can begin.

The PCM3070EVM-K software can now be launched. The user sees an initial screen that looks similar to Figure 2.

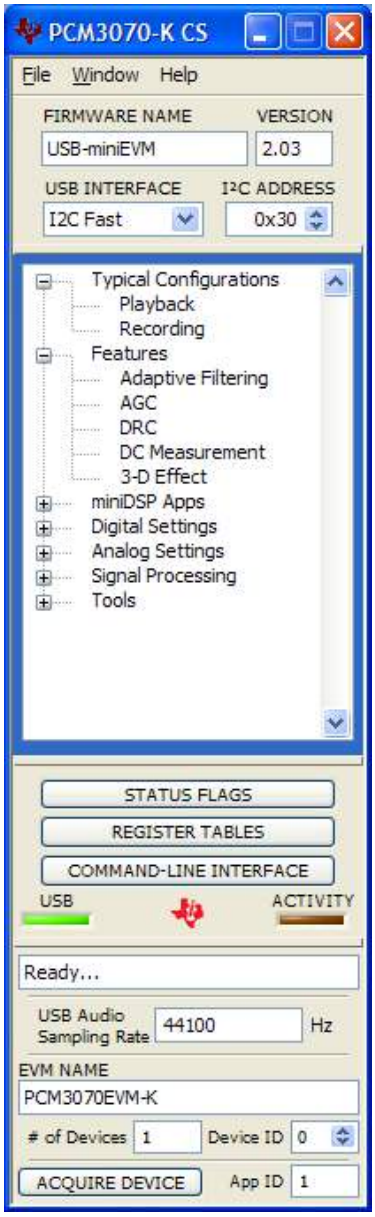

Figure 2. Initial Screen of PCM3070EVM-K Software

If running the software in Windows Vista or Windows 7, right-click the PCM3070EVM-K CS shortcut and select *Properties*. Configure the *Compatibility* tab as shown in Figure 3

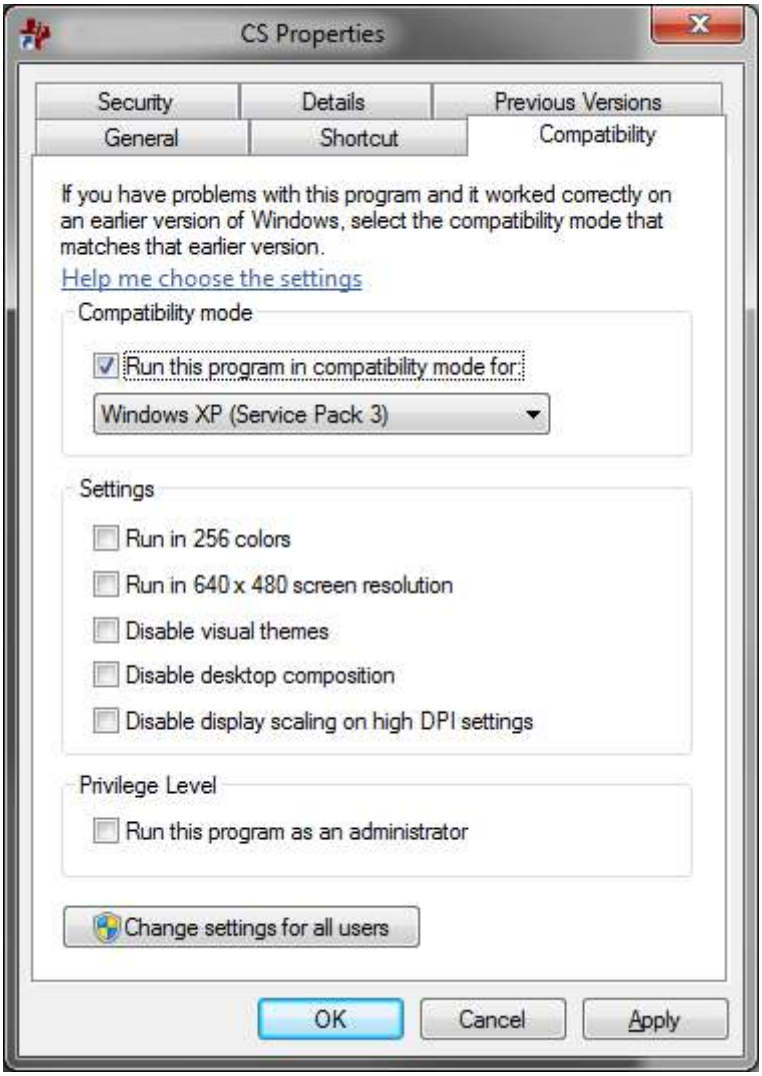

Figure 3. Compatibility Tab

4 PCM3070 Control Software

The PCM3070 Control Software (CS) is an intuitive, easy-to-use, powerful tool to learn, evaluate, and control the PCM3070. This tool was specifically designed to make learning the PCM3070 software easy. The following sections describe the operation of this software.

4.1 Main Panel Window

The Main Panel window, shown in Figure 2, provides easy access to all the features of the PCM3070-K CS. The Firmware Name and Version boxes provide information about the firmware loaded into the EVM's EEPROM.

The USB-MODEVM Interface drop-down menu allows the user to select which communication protocol the TAS1020B USB Controller uses to communicate with the PCM3070 or to toggle the TAS1020B GPIO pins. The PCM3070 supports I^2C Standard, I^2C Fast, and 8-bit register SPI. The USB-MODEVM Interface selection is global to all panels, including the Command-Line Interface. To communicate to the PCM3070 using SPI, SW1 must be switched towards SPI and W14 must be set to 1-2 on the PCM3070EVM.

The Panel Selection Tree provides access to typical configurations, features, and other panels that allow the user to control the PCM3070. The tree is divided into several categories which contain items that pop up panels. A panel can be opened by double-clicking any item inside a category in the Panel Selection Tree.

Below the Panel Selection Tree are three buttons that pop up the following:

- Status Flags - Allows the user to monitor the PCM3070 status flags.
- Register Tables - A tool to monitor register pages.
- Command-Line Interface - A tool to execute/generate scripts and monitor register activity.

The USB LED indicates if the EVM kit is recognized by the software and the ACTIVITY LED illuminates every time a command request is sent.

The dialog box at the bottom of the Main Panel provides feedback of the current status of the software.

4.1.1 Typical Configurations

This category can help users to quickly become familiar with the PCM3070. Each of the panels that can be accessed through this menu have controls relevant to the selected configuration; a tab shows the script that will be loaded for that particular configuration. Each script includes a brief description of the selected configuration, as shown in Figure 4.

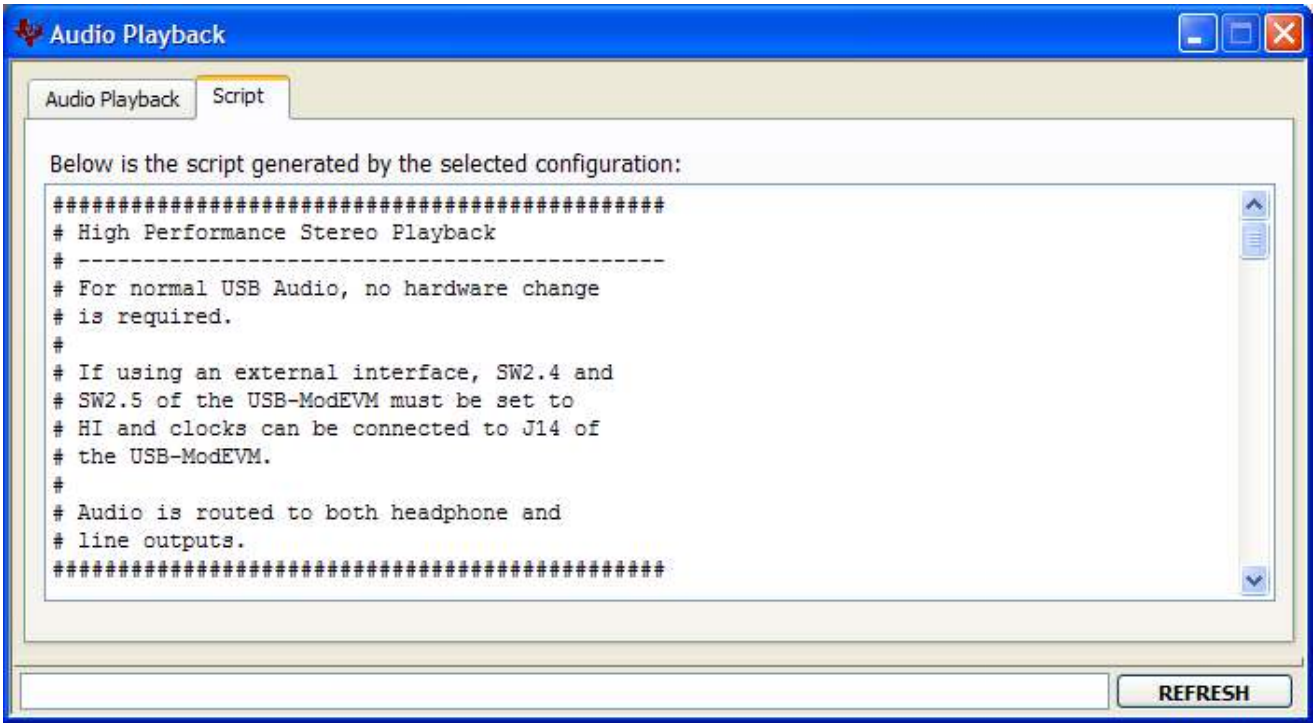

Figure 4. Playback Script Tab

4.1.1.1 Playback

The Playback panel (shown in Figure 5) has the following configurations:

- High Performance Stereo Playback - this configuration programs the PCM3070 for low-noise, high-performance stereo playback through both line and headphone outputs.
- Direct Analog Bypass - this configuration routes IN1_L/IN1_R to HPL/HPR.
- PGA Analog Bypass - this configuration routes IN1_L/IN1_R to the analog input amplifier (Mic PGA) which is then routed to both the line and headphone amplifiers.

The analog inputs and outputs used for these configurations can be accessed as follows:

1. IN1_L / IN1_R - Jack J1 or terminal block J2.
2. Line outputs - Jack J7 or terminal block J6.
3. Headphone outputs - Jack J9 or terminal block J8.

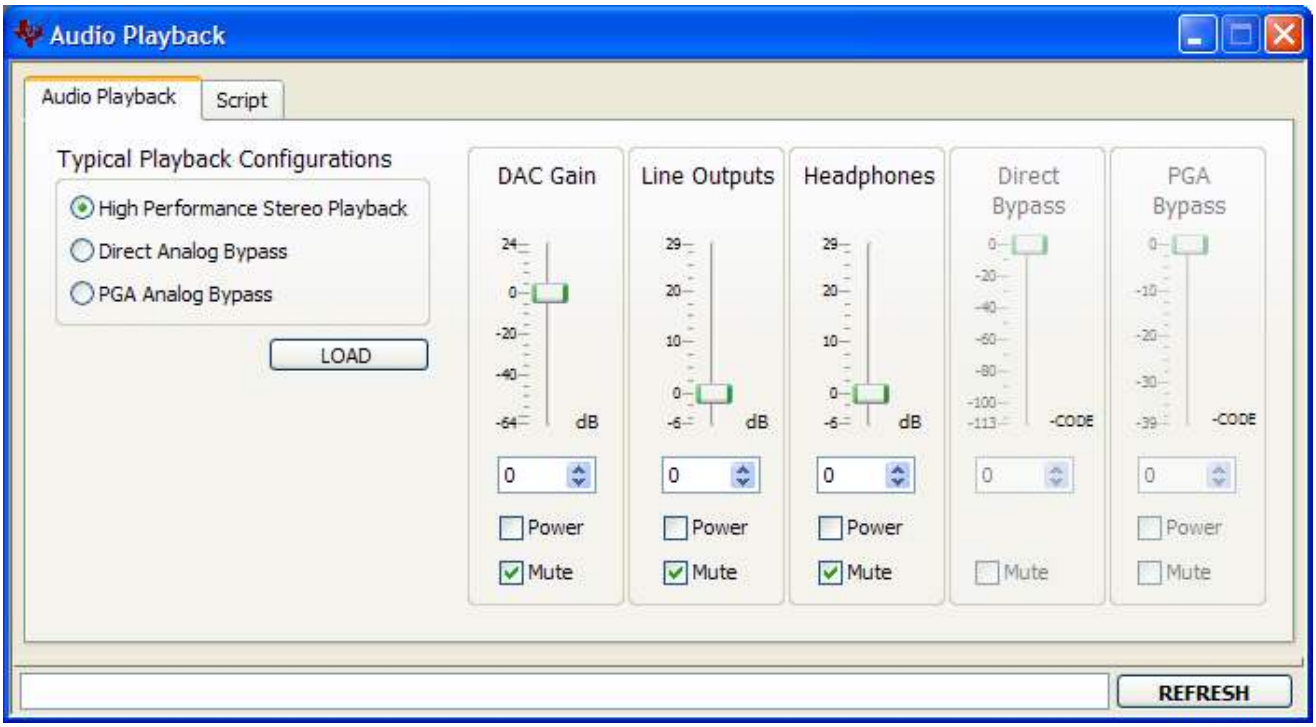

Figure 5. Playback Panel

4.1.1.2 Audio Recording

The Audio Recording panel (shown in Figure 6) has the following configurations:

- High Performance Stereo Recording - this configuration programs the PCM3070 for low-noise, high-performance stereo recording. IN1_L and IN1_R are routed in a single-ended fashion.

  The analog inputs used for these configurations can be accessed as follows:

  1. IN1_L / IN1_R - Jack J1 or terminal block J2.

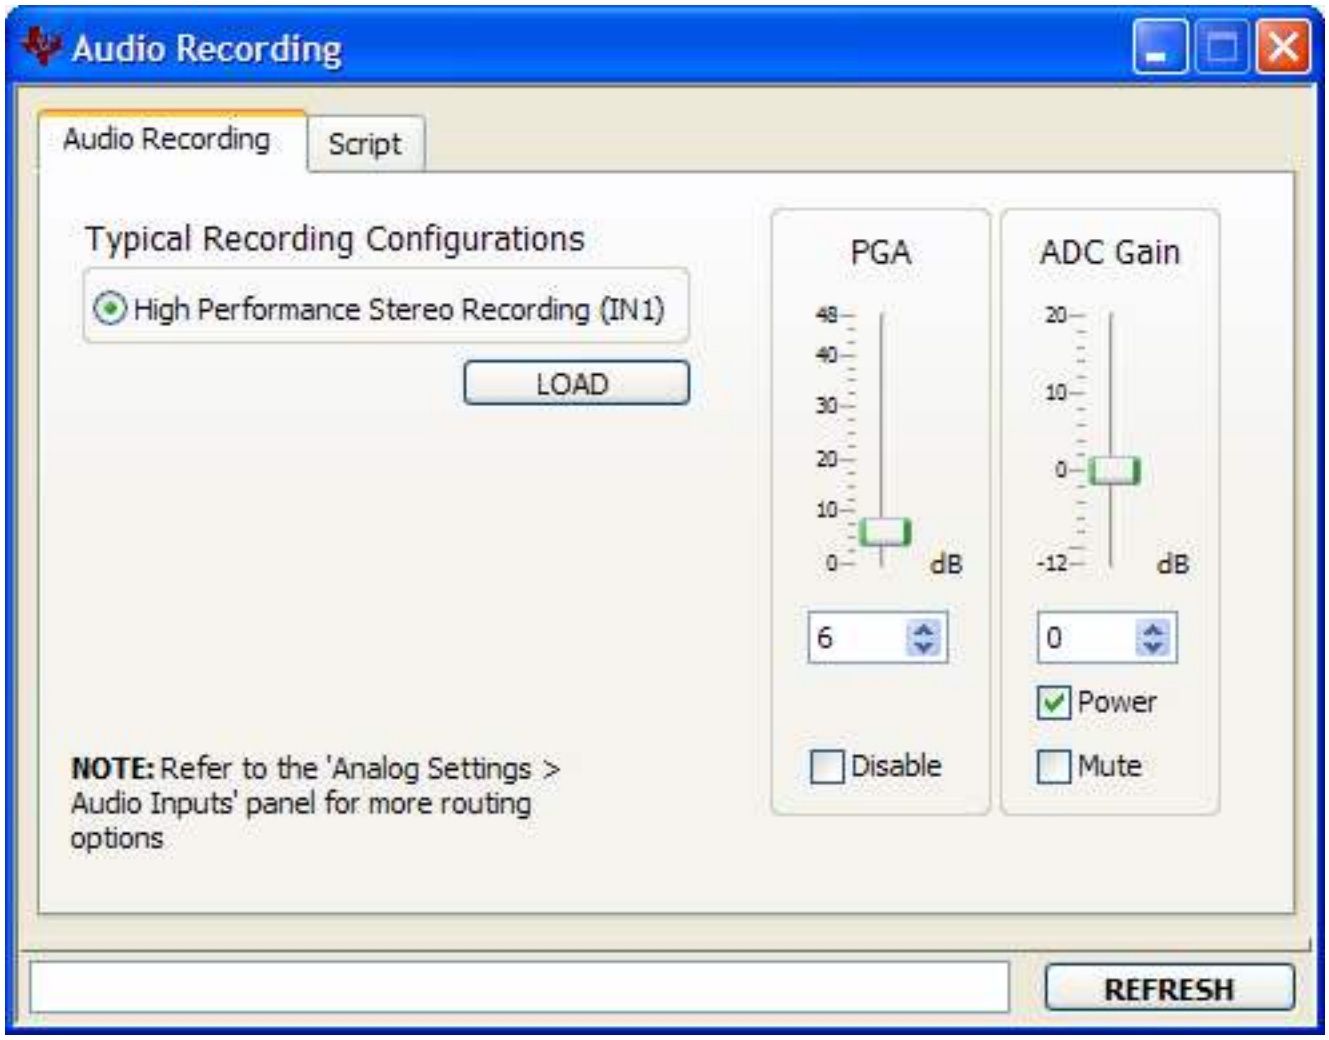

Figure 6. Audio Recording Panel

4.1.2 Features

The **Features** category allows the user to evaluate various features of the PCM3070. Each of the **Features** panels include an **Information** tab that explains the feature and provides hardware setup information for easy evaluation, as seen in Figure 7.

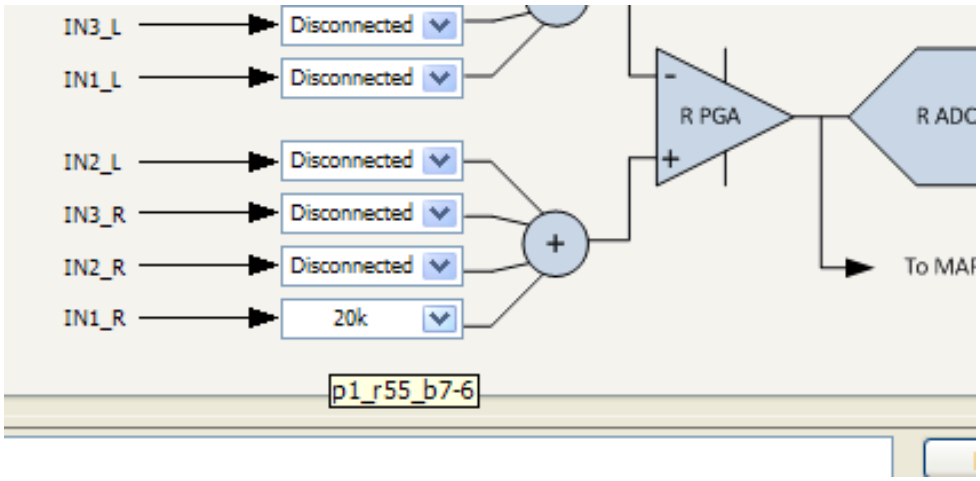

Figure 7. DRC Information Tab

Any item in the **Features** category can be accessed by a double-click. As soon as a **Features** panel opens, a pop-up message appears asking to program the codec for that feature (see Figure 8). A command script is sent to the codec if the **OK** button is clicked. This script programs all registers necessary to evaluate the feature. This can be bypassed by clicking the **Cancel** button.

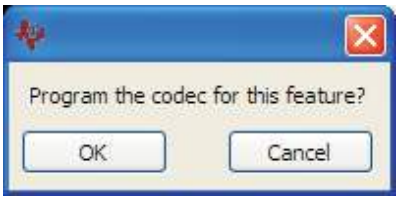

Figure 8. Program Codec Pop-Up Window

The script corresponding to each feature can be accessed at the Installation Directory\DATA\EVM folder. Also, each script can be manually customized and loaded as the feature's start-up script as long as the file name remains the same.

4.1.3 miniDSP Applications

The PCM3070 features two miniDSP cores, one for the ADC and another for the DAC.

Currently, the PCM3070-K CS has two DAC miniDSP applications: Equalizers and Spectrum Analyzer. Visit the PCM3070EVM-K product folder for updates and availability on new miniDSP applications.

See the miniDSP section in the data sheet (SLAS549) for information on how to develop custom miniDSP algorithms.

4.1.4 Control Categories

The **Digital Settings**, **Analog Settings**, and **Signal Processing** categories provide control of many registers and other features of the PCM3070 . These categories are intended for the advanced user. Hovering the mouse cursor on top of a control displays a tip strip that contains page, register, and bit information. As an example, hovering on top of IN1_R of the Audio Inputs panel, as shown in Figure 9 displays p1_r55_b7-6 which means that this control writes to Page 1/Register 55/Bits D7 to D6.

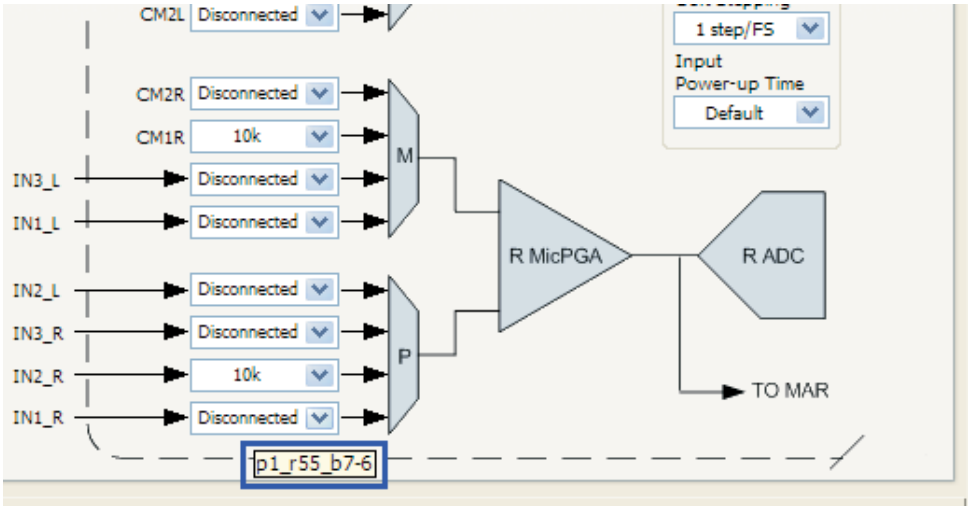

Figure 9. Audio Inputs Panel

Before changing a control, see the data sheet to ensure that a particular control is compatible with the current state of the codec. As an example, some controls in the **Analog Setup** panel must be modified in a particular order as described in the data sheet. Other controls must only be modified with a specific hardware setup, such as powering up the AVDD LDO.

All controls update their status with respect to the register contents in the following conditions:

- A panel is opened.
- The **Execute Command Buffer** button in the **Command-Line Interface** is pressed.
- The **Refresh** button at the bottom right of a panel is pressed.

4.2 Status Flags Panel

The PCM3070 status flags can monitored in the **Status Flags** panel (Figure 10) which is located below the **Panel Selection Tree** . Pressing the **POLL** button continuously reads all the registers relevant to each flag and updates those flags accordingly. The rate at which the registers are read can be modified by changing the value in the **Polling Interval** numeric control. Note that a smaller interval reduces responsiveness of other controls, especially volume sliders, due to bandwidth limitations. By default, the polling interval is 200 ms and can be set to a minimum of 20 ms.

The **Sticky Flags** tab contains indicators whose corresponding register contents clear every time a read is performed to that register. To read all the sticky flags, click the **Read Sticky Flags** button.

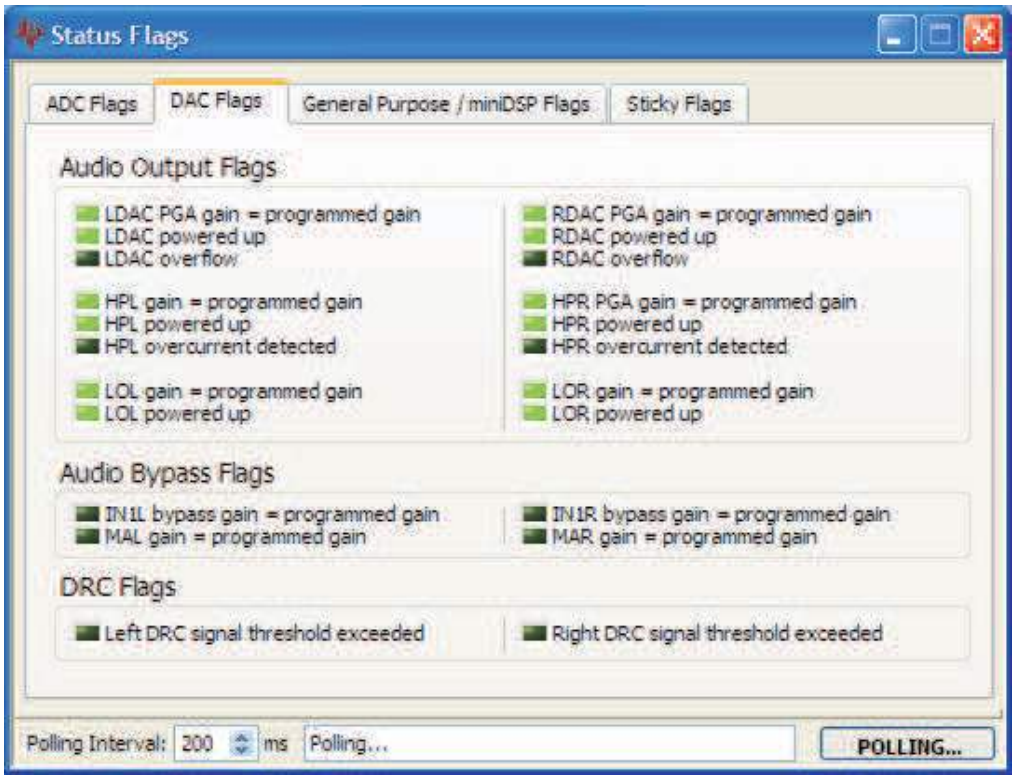

Figure 10. Status Flags Panel

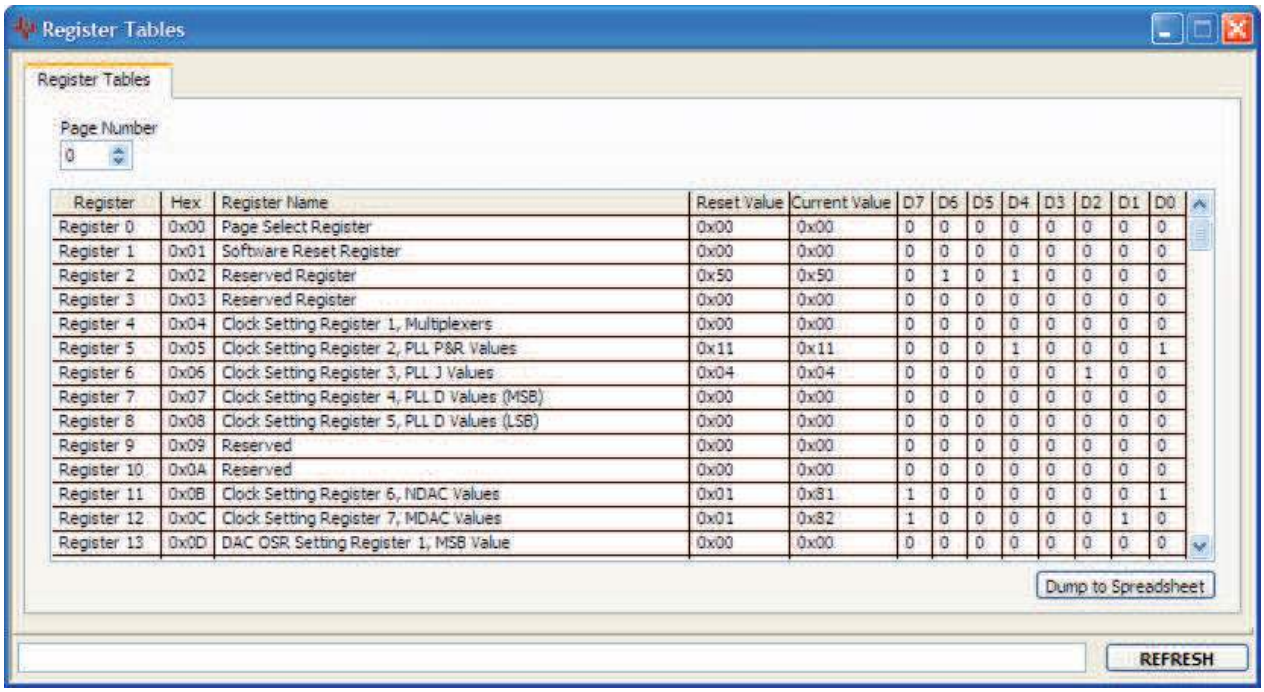
4.3 Register Tables Panel

The contents of configuration and coefficient pages of the PCM3070 can be accessed through the **Register Tables** panel (Figure 11).

The **Page Number** control changes to the page to be displayed in the register table. The register table contains page information such as the register name, reset value, current value, and a bitmap of the current value. The contents of the selected page can be exported into a spreadsheet by clicking the **Dump to Spreadsheet** button.



Register	Hex	Register Name	Reset Value	Current Value	D7	D6	D5	D4	D3	D2	D1	D0
Register 0	0x00	Page Select Register	0x00	0x00	0	0	0	0	0	0	0	0
Register 1	0x01	Software Reset Register	0x00	0x00	0	0	0	0	0	0	0	0
Register 2	0x02	Reserved Register	0x50	0x50	0	1	0	1	0	0	0	0
Register 3	0x03	Reserved Register	0x00	0x00	0	0	0	0	0	0	0	0
Register 4	0x04	Clock Setting Register 1, Multiplexers	0x00	0x00	0	0	0	0	0	0	0	0
Register 5	0x05	Clock Setting Register 2, PLL P&R Values	0x11	0x11	0	0	0	1	0	0	0	1
Register 6	0x06	Clock Setting Register 3, PLL J Values	0x04	0x04	0	0	0	0	0	1	0	0
Register 7	0x07	Clock Setting Register 4, PLL D Values (MSB)	0x00	0x00	0	0	0	0	0	0	0	0
Register 8	0x08	Clock Setting Register 5, PLL D Values (LSB)	0x00	0x00	0	0	0	0	0	0	0	0
Register 9	0x09	Reserved	0x00	0x00	0	0	0	0	0	0	0	0
Register 10	0x0A	Reserved	0x00	0x00	0	0	0	0	0	0	0	0
Register 11	0x0B	Clock Setting Register 6, NDAC Values	0x01	0x81	1	0	0	0	0	0	0	1
Register 12	0x0C	Clock Setting Register 7, MDAC Values	0x01	0x82	1	0	0	0	0	0	1	0
Register 13	0x0D	DAC OSR Setting Register 1, MSB Value	0x00	0x00	0	0	0	0	0	0	0	0

Figure 11. Register Tables Panel

4.4 Command-Line Interface Panel

The **Command-Line Interface** panel provides a means to communicate with the PCM3070 using a simple scripting language (described in Section F.1). The TAS1020B USB Controller (located on the USB-MODEVM motherboard) handles all communication between the PC and the PCM3070.

A script is loaded into the command buffer, either by loading a script file using the **File** menu or by pasting text from the clipboard using the Ctrl-V key combination (Figure 12).

When the command buffer is executed, the return data packets which result from each individual command are displayed in the **Command History** control. This control is an array (with a maximum size of 100 elements) that contains information about each command as well as status. The **Interface** box displays the interface used for a particular command in the **Command History** array. The Command box displays the type of command executed (i.e., write, read) for a particular interface. The Flag Retries box displays the number of read iterations performed by a **Wait for Flag** command (see Section F.1 for details). The **Register Data** array displays the register number and data bytes that correspond to a particular command.

The **Information** tab provides additional information related to the **Command History** as well as additional settings. The **Syntax** and **Examples** tabs provide useful information related to the scripting language.

The **File** menu provides some options for working with scripts. The first option, *Open Script File...*, loads a command file script into the command buffer. This script can then be executed by pressing the **Execute Command Buffer** button. The contents of the **Command Buffer** can be saved using the *Save Script File...* option.

Both the **Command Buffer** and **Command History** can be cleared by clicking their corresponding **Clear** buttons.

Appendix A EVM Connector Descriptions

This appendix contains the connection details for each of the main connectors on the EVM.

A.1 Analog Interface Connectors

A.1.1 Analog Dual-Row Socket Details, J11 and J21

The PCM3070EVM has two analog dual-row sockets located at the bottom of the board. These sockets provide support to the EVM and connect the analog ground plane of the EVM to the USB-MODEVM analog ground. Consult Samtec at www.samtec.com or call 1-800-SAMTEC-9 for a variety of mating connector options. Table 3 summarizes the analog interface pinout for the PCM3070EVM.

A.2 Digital Interface Connectors, P12/J12 and P22/J22

The PCM3070EVM is designed to easily interface with multiple control platforms. Samtec part numbers SSW-110-22-F-D-VS-K and TSM-110-01-T-DV-P provide a convenient 10-pin, dual-row header/socket combination at P12/J12 and P22/J22. These headers/sockets provide access to the digital control and serial data pins of the device. Consult Samtec at www.samtec.com or call 1-800- SAMTEC-9 for a variety of mating connector options. Table 5 summarizes the digital interface pinout for the PCM3070EVM.

Note that P22/J22 comprises the signals needed for an I²S™ serial digital audio interface; the control interface (I²C™ and $\overline{\text{RESET}}$) signals are routed to P12/J12.

A.3 Power Supply Connector Pin Header, P23/J23

P23/J23 provides connection to the common power bus for the PCM3070EVM. Power is supplied on the pins listed in Table 6.

Table 6. Power Supply Pinout

SIGNAL	PIN NUMBER		SIGNAL
NC	P23.1/J23.1	P23.2/J23.2	NC
+5VA	P23.3/J23.3	P23.4/J23.4	NC
DGND	P23.5/J23.5	P23.6/J23.6	AGND
+1.8VD	P23.7/J23.7	P23.8/J23.8	NC
+3.3VD	P23.9/J23.9	P23.10/J23.10	+5VD

The PCM3070EVM-K motherboard (the USB-MODEVM Interface board) supplies power to P23/J23 of the PCM3070EVM. Power for the motherboard is supplied either through its USB connection or via terminal blocks on that board.

Appendix B PCM3070EVM Schematic

The schematic diagram for the PCM3070EVM is provided as a reference.

	Jumper plug	Samtec	SNT-100-BK-T

Appendix F USB-MODEVM Protocol

F.1 Writing Scripts

A script is simply a text file that contains data to send to the serial control buses.

Each line in a script file is one command. No provision is made for extending lines beyond one line, except for the **>** command. A line is terminated by a carriage return.

The first character of a line is the command. Commands are:

l Set interface bus to use
r Read from the serial control bus
w Write to the serial control bus
> Extend repeated write commands to lines below a **w**
Comment
b Break
d Delay

f Wait for flag

The first command, **l**, sets the interface to use for the commands to follow. This command must be followed by one of the following parameters:

i2cstd	Standard mode I^2C bus
i2cfast	Fast mode I^2C bus
spi8	SPI bus with 8-bit register addressing
spi16	SPI bus with 16-bit register addressing
gpio	Use the USB-MODEVM GPIO capability

For example, if a fast mode I^2C bus is to be used, the script begins with:

l i2cfast

A double-quoted string of characters following the **b** command can be added to provide information to the user about each breakpoint. When the script is executed, the software's command handler halts as soon as a breakpoint is detected and displays the string of characters within the double quotes.

The Wait for Flag command, **f,** reads a specified register and verifies if the bitmap provided with the command matches the data being read. If the data does not match, the command handler retries for up to 200 times. This feature is useful when switching buffers in parts that support the adaptive filtering mode. The command f syntax follows:

```
f [i2c address] [register] [D7][D6][D5][D4][D3][D2][D1][D0]
where 'i2c address' and 'register' are in hexadecimal format and 'D7' through 'D0' are in binary
format with values of 0, 1 or X for don't care.
```

Anything following a comment command **#** is ignored by the parser, provided that it is on the same line.

The delay command **d** allows the user to specify a time, in milliseconds, that the script pauses before proceeding. **The delay time is entered in decimal format.**

A series of byte values follows either a read or write command. Each byte value is expressed in hexadecimal, and each byte must be separated by a space. Commands are interpreted and sent to the TAS1020B by the program using the protocol described in **Section G1** (**doesn't exist**).

The first byte following an **r** (read) or **w** (write) command is the I^2C slave address of the device (if I^2C is used) or the first data byte to write (if SPI is used—note that SPI interfaces are not standardized on protocols, so the meaning of this byte varies with the device being addressed on the SPI bus). The second byte is the starting register address that data will be written to (again, with I^2C; SPI varies—see **Section G1** (**doesn't exist**) for additional information about what variations may be necessary for a particular SPI mode). Following these two bytes are data, if writing; if reading, the third byte value is the number of bytes to read, (expressed in hexadecimal).

For example, to write the values 0xAA 0x55 to an I^2C device with a slave address of 0x30, starting at a register address of 0x03, the user writes:

```
#example script
I i2cfast
w 30 03 AA 55
r 30 03 02
```

This script begins with a comment, specifies that a fast I^2C bus will be used, then writes *0xAA 0x55* to the I^2C slave device at address 0x30, writing the values into registers 0x03 and 0x04. The script then reads back two bytes from the same device starting at register address 0x03. Note that the slave device value does not change. It is unnecessary to set the R/$\overline{W}$ bit for I^2C devices in the script; the read or write commands does that.

If extensive repeated write commands are sent and commenting is desired for a group of bytes, the **>** command can be used to extend the bytes to other lines that follow. A usage example for the **>** command follows:

```
#example script for '>' command
I i2cfast
# Write AA and BB to registers 3 and 4, respectively
w 30 03 AA BB
# Write CC, DD, EE and FF to registers 5, 6, 7 and 8, respectively
> CC DD EE FF
# Place a commented breakpoint
b "AA BB CC DD EE FF was written, starting at register 3"
# Read back all six registers, starting at register 3
r 30 03 06
```

The following example demonstrates usage of the Wait for Flag command, **f**:

```
#example script for 'wait for flag' command
I i2cfast
# Switch to Page 44
w 30 00 2C
# Switch buffers
w 30 01 05
# Wait for bit D0 to clear. 'x' denotes a don't care.
f 30 01 xxxxxxx0
```

Any text editor can be used to write these scripts; Jedit is an editor that is highly recommended for general usage. For more information, go to: http://www.jedit.org.

Once the script is written, it can be used in the command window by running the program, and then selecting *Open Script File...* from the File menu. Locate the script and open it. The script is then displayed in the command buffer. The user can also edit the script once it is in the buffer and save it by selecting *Save Script File...* from the File menu.

Once the script is in the command buffer, it can be executed by pressing the *Execute Command Buffer* button. If breakpoints are in the script, the script executes to that point, and the user is presented with a dialog box with a button to press to continue executing the script. When ready to proceed, push that button and the script continues.

Evaluation Board/Kit Important Notice

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. Persons handling the product(s) must have electronics training and observe good engineering practice standards. As such, the goods being provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives or other related directives.

Should this evaluation board/kit not meet the specifications indicated in the User's Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive.**

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.**

Please read the User's Guide and, specifically, the Warnings and Restrictions notice in the User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For additional information on TI's environmental and/or safety programs, please contact the TI application engineer or visit www.ti.com/esh.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

FCC Warning

This evaluation board/kit is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY** and is not considered by TI to be a finished end-product fit for general consumer use. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

EVM Warnings and Restrictions

It is important to operate this EVM within the input voltage range of 6 Vdc to 10 Vdc and the output voltage range of 0 V to 3.6 V .

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 85°C. The EVM is designed to operate properly with certain components above 85°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
