

FEATURES

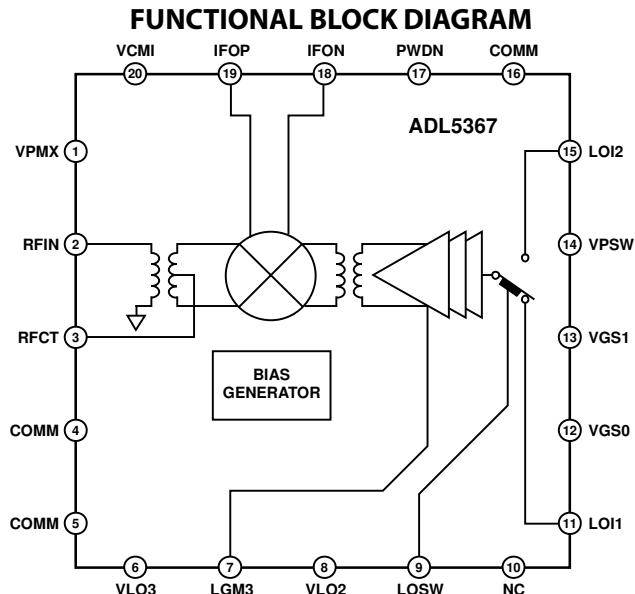

RF frequency range of 500 MHz to 1700 MHz
IF frequency range of 30 MHz to 450 MHz
Power conversion loss: 7.7 dB
SSB noise figure of 8.3 dB
SSB noise figure with 5 dBm blocker of 21 dB
Input IP3 of 34 dBm
Typical LO drive of 0 dBm
Single-ended, 50 Ω RF and LO input ports
High isolation SPDT LO input switch
Single-supply operation: 3.3 V to 5 V
Exposed paddle 5 mm × 5 mm, 20-lead LFCSP
1500 V HBM/500 V FICDM ESD performance

APPLICATIONS

Cellular base station receivers
Transmit observation receivers
Radio link downconverters

GENERAL DESCRIPTION

The **ADL5367** uses a highly linear, doubly balanced passive mixer core along with integrated RF and LO balancing circuitry to allow for single-ended operation. The **ADL5367** incorporates an RF balun, allowing optimal performance over a 500 MHz to 1700 MHz RF input frequency range. Performance is optimized for RF frequencies from 500 MHz to 1200 MHz using a high-side LO and for RF frequencies from 900 MHz to 1700 MHz using a low-side LO. The balanced passive mixer arrangement provides good LO to RF leakage, typically better than –35 dBm, and excellent intermodulation performance. The balanced mixer core also provides extremely high input linearity, allowing the device to be used in demanding cellular applications where in-band blocking signals may otherwise result in the degradation of dynamic performance. A high linearity IF buffer amplifier follows the passive mixer core to yield a typical power conversion loss of 7.7 dB and can be used with a wide range of output impedances.

NC = NO CONNECT

08083-001

Figure 1.

The **ADL5367** provides two switched LO paths that can be used in TDD applications where it is desirable to rapidly switch between two local oscillators. LO current can be externally set using a resistor to minimize dc current commensurate with the desired level of performance. For low voltage applications, the **ADL5367** is capable of operation at voltages down to 3.3 V with substantially reduced current. Under low voltage operation, an additional logic pin is provided to power down (<200 μA) the circuit when desired.

The **ADL5367** is fabricated using a BiCMOS high performance IC process. The device is available in a 5 mm × 5 mm, 20-lead LFCSP and operates over a –40°C to +85°C temperature range. An evaluation board is also available.

ABSOLUTE MAXIMUM RATINGS

Table 5.

| Parameter | Rating |
|--|-----------------|
| Supply Voltage, V_s | 5.5 V |
| RF Input Level | 20 dBm |
| LO Input Level | 13 dBm |
| IFOP, IFON Bias Voltage | 6.0 V |
| VGS0, VGS1, LOSW, PWDN | 5.5 V |
| Internal Power Dissipation | 1.2 W |
| Maximum Junction Temperature | 150°C |
| Operating Temperature Range | -40°C to +85°C |
| Storage Temperature Range | -65°C to +150°C |
| Lead Temperature Range (Soldering, 60 sec) | 260°C |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is thermal resistance, junction to ambient (°C/W), and θ_{JB} is thermal impedance, junction to board (°C/W).

Table 6. Thermal Resistance

| Package Type | θ_{JA}^1 | θ_{JB}^1 | Unit |
|---------------|-----------------|-----------------|------|
| 20-Lead LFCSP | 25 | 14.74 | °C/W |

¹ See the JEDEC standard, JESD51-2, for information on optimizing thermal impedance (PCB with 3 × 3 vias).

Junction to Board Thermal Impedance

The junction to board thermal impedance (θ_{JB}) is the thermal impedance from the die to or near the component lead of the ADL5367. For the ADL5367, θ_{JB} is determined experimentally to 14.74°C/W with the device mounted on a 4-layer circuit board with two layers as ground planes in a configuration similar to the ADL5367-EVALZ evaluation board. Board size and complexity (number of layers) affect θ_{JB} ; more layers tend to reduce the thermal impedance slightly.

If the board temperature is known, use the junction to board thermal impedance to calculate die temperature (also known as junction temperature) to ensure it does not exceed the specified limit of 150°C. For example if the board temperature is 85°C, the die temperature is given by the equation

$$T_j = T_B + (P_{DISS} \times \theta_{JB})$$

where T_j is the junction temperature.

T_B is the board temperature measured at or near the component lead.

P_{DISS} is the power dissipated from the device.

The typical worst case power dissipation for the ADL5367 is 605 mW (5.5 V × 110 mA). Therefore T_j is

$$T_j = 85^\circ\text{C} + (0.605 \text{ W} \times 14.74^\circ\text{C/W}) = 93.91^\circ\text{C}$$

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

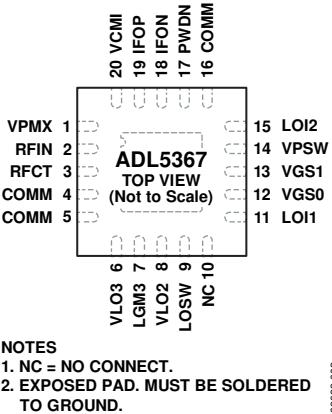

Figure 2. Pin Configuration

Table 7. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
|----------|------------|--|
| 1 | VPMX | Positive Supply Voltage for IF Amplifier. |
| 2 | RFIN | RF Input. This pin must be ac-coupled. |
| 3 | RFCT | RF Balun Center Tap (AC Ground). |
| 4, 5, 16 | COMM | Device Common (DC Ground). |
| 6, 8 | VLO3, VLO2 | Positive Supply Voltages for LO Amplifier. |
| 7 | LGM3 | LO Amplifier Bias Control. |
| 9 | LOSW | LO Switch. LOI1 selected for 0 V, or LOI2 selected for 3 V. |
| 10 | NC | No Connect. |
| 11, 15 | LOI1, LOI2 | LO Inputs. This pin must be ac-coupled. |
| 12, 13 | VGS0, VGS1 | Mixer Gate Bias Controls. 3 V logic. Ground these pins for nominal setting. |
| 14 | VPSW | Positive Supply Voltage for LO Switch. |
| 17 | PWDN | Power Down. Connect this pin to ground for normal operation or connect this pin to 3.0 V for disable mode. |
| 18, 19 | IFON, IFOP | Differential IF Outputs. |
| 20 | VCMI | No Connect. This pin can be grounded. |
| | EPAD (EP) | Exposed pad must be soldered to ground. |

TYPICAL PERFORMANCE CHARACTERISTICS

5 V PERFORMANCE

$V_S = 5$ V, $I_S = 97$ mA, $T_A = 25^\circ\text{C}$, $f_{\text{RF}} = 900$ MHz, $f_{\text{LO}} = 1103$ MHz, LO power = 0 dBm, $\text{VGS}0 = \text{VGS}1 = 0$ V, and $Z_O = 50 \Omega$, unless otherwise noted.

SPUR TABLES

All spur tables are $(N \times f_{RF}) - (M \times f_{LO})$ and were measured using the standard evaluation board. Mixer spurious products are measured in dBc from the IF output power level. Data was measured only for frequencies less than 6 GHz. Typical noise floor of the measurement system = -100 dBm.

5 V Performance

$V_S = 5$ V, $I_S = 97$ mA, $T_A = 25^\circ\text{C}$, $f_{RF} = 900$ MHz, $f_{LO} = 1103$ MHz, LO power = 0 dBm, RF power = 0 dBm, $VGS0 = VGS1 = 0$ V, and $Z_O = 50 \Omega$, unless otherwise noted.

CIRCUIT DESCRIPTION

The ADL5367 consists of two primary components: the radio frequency (RF) subsystem and the local oscillator (LO) subsystem. The combination of design, process, and packaging technology allows the functions of these subsystems to be integrated into a single die, using mature packaging and interconnection technologies to provide a high performance, low cost design with excellent electrical, mechanical, and thermal properties. In addition, the need for external components is minimized, optimizing cost and size.

The RF subsystem consists of an integrated, low loss RF balun, passive MOSFET mixer, sum termination network, and IF amplifier.

The LO subsystem consists of an SPDT terminated FET switch and a three-stage limiting LO amplifier. The purpose of the LO subsystem is to provide a large, fixed amplitude, balanced signal to drive the mixer independent of the level of the LO input.

A block diagram of the device is shown in Figure 47.

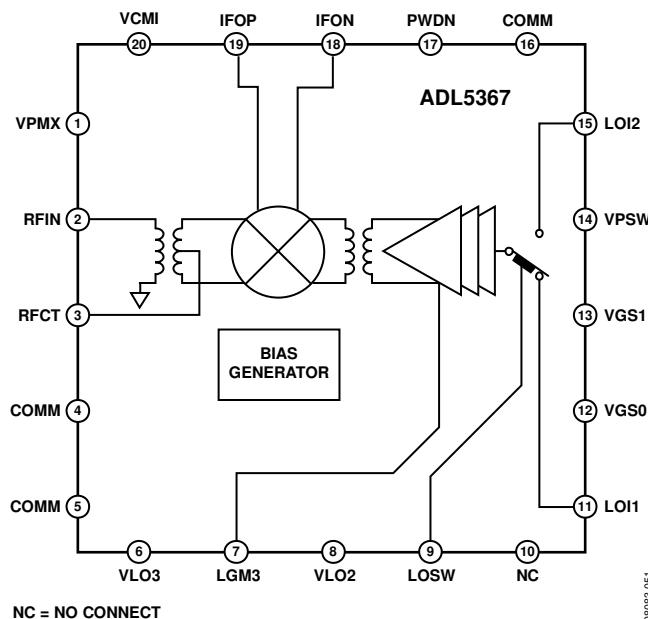

Figure 47. Simplified Schematic

RF SUBSYSTEM

The single-ended, $50\ \Omega$ RF input is internally transformed to a balanced signal using a low loss ($<1\ \text{dB}$) unbalanced to balanced (balun) transformer. This transformer is made possible by an extremely low loss metal stack, which provides both excellent balance and dc isolation for the RF port. Although the port can be dc connected, it is recommended that a blocking capacitor be used to avoid running excessive dc current through the device. The RF balun can easily support an RF input frequency range of 500 MHz to 1700 MHz.

The resulting balanced RF signal is applied to a passive mixer that commutes the RF input with the output of the LO subsystem. The passive mixer is essentially a balanced, low loss switch that adds minimum noise to the frequency translation. The only noise contribution from the mixer is due to the resistive loss of the switches, which is in the order of a few ohms.

Because the mixer is inherently broadband and bidirectional, it is necessary to properly terminate all the idler ($M \times N$ product) frequencies generated by the mixing process. Terminating the mixer avoids the generation of unwanted intermodulation products and reduces the level of unwanted signals at the IF output. This termination is accomplished by the addition of a sum network between the IF output and the mixer.

Additionally, dc current can be saved by reducing the dc supply voltage to as low as 3.3 V, further reducing the dissipated power of the device. (Note that no performance enhancement is obtained by reducing the value of these resistors and excessive dc power dissipation may result.)

LO SUBSYSTEM

The LO amplifier is designed to provide a large signal level to the mixer to obtain optimum intermodulation performance. The resulting amplifier provides extremely high performance centered on an operating frequency of 1100 MHz. The best operation is achieved with either high-side LO injection for RF signals in the 500 MHz to 1200 MHz range or low-side injection for RF signals in the 900 MHz to 1700 MHz range. Operation outside these ranges is permissible, and conversion loss is extremely wideband, easily spanning 500 MHz to 1700 MHz, but intermodulation is optimal over the aforementioned ranges.

The ADL5367 has two LO inputs permitting multiple synthesizers to be rapidly switched with extremely short switching times ($<40\ \text{ns}$) for frequency agile applications. The two inputs are applied to a high isolation SPDT switch that provides a constant input impedance, regardless of whether the port is selected, to avoid pulling the LO sources. This multiple section switch also ensures high isolation to the off input, minimizing any leakage from the unwanted LO input that may result in undesired IF responses.

The single-ended LO input is converted to a fixed amplitude differential signal using a multistage, limiting LO amplifier. This results in consistent performance over a range of LO input power. Optimum performance is achieved from $-6\ \text{dBm}$ to $+10\ \text{dBm}$, but the circuit continues to function at considerably lower levels of LO input power.

The performance of this amplifier is critical in achieving a high intercept passive mixer without degrading the noise floor of the system. This is a critical requirement in an interferer rich environment, such as cellular infrastructure, where blocking interferers can limit mixer performance. The bandwidth of the intermodulation performance is somewhat influenced by the current in the LO amplifier chain. For dc current sensitive applications, it is permissible to reduce the current in the LO amplifier by raising the value of the external bias control resistor. For dc current critical applications, the LO chain can operate with a supply voltage as low as 3.3 V, resulting in substantial dc power savings.

In addition, when operating with supply voltages below 3.6 V, the [ADL5367](#) has a power-down mode that permits the dc current to drop to <200 μ A.

All of the logic inputs are designed to work with any logic family that provides a Logic 0 input level of less than 0.4 V and a Logic 1 input level that exceeds 1.4 V. All logic inputs are high impedance up to Logic 1 levels of 3.3 V. At levels exceeding 3.3 V, protection circuitry permits operation up to 5.5 V, although a small bias current is drawn.

APPLICATIONS INFORMATION

BASIC CONNECTIONS

The [ADL5367](#) mixer is designed to upconvert or downconvert between radio frequencies (RF) from 500 MHz to 1700 MHz and intermediate frequencies (IF) from dc to 450 MHz. Figure 48 depicts the basic connections of the mixer. It is recommended to ac-couple the RF and LO input ports to prevent nonzero dc voltages from damaging the RF balun or LO input circuit. The RFIN capacitor value of 8 pF is recommended to provide the optimized RF input return loss for the desired frequency band.

For upconversion, the IF input, Pin 18 (IFON) and Pin 19 (IFOP), must be driven differentially or using a 1:1 ratio transformer for single ended operation. An 8 pF capacitor is recommended for the RF output, Pin 2 (RFIN).

IF PORT

The real part of the output impedance is approximately $50\ \Omega$, as seen in Figure 26, which matches many commonly used SAW filters without the need for a transformer. This results in a voltage conversion loss that is approximately the same as the power conversion loss, as shown in Table 3.

MIXER VGS CONTROL DAC

The [ADL5367](#) features two logic control pins, Pin 12 (VGS0) and Pin 13 (VGS1), that allow programmability for internal gate to source voltages for optimizing mixer performance over desired frequency bands. The evaluation board defaults both VGS0 and VGS1 to ground. Power conversion loss, NF, and IIP3 can be optimized, as shown in Figure 35 and Figure 36.

EVALUATION BOARD

An evaluation board is available for the family of double balanced mixers. The standard evaluation board schematic is shown in Figure 49. The evaluation board, [ADL5367-EVALZ](#), is fabricated using Rogers® RO3003 material.

Table 8 describes the various configuration options of the evaluation board. The evaluation board layout is shown in Figure 50 to Figure 53.

Table 8. Evaluation Board Configuration

| Components | Description | Default Conditions |
|--|--|--|
| C2, C6, C8, C20, C21 | Power Supply Decoupling. Nominal supply decoupling consists of a 10 μF capacitor to ground in parallel with a 10 pF capacitor to ground positioned as close to the device as possible. | C2 = 10 μF (Size 0603), C6, C8, C20, C21 = 10 pF (Size 0402) |
| C1, C4, C5 | RF Input Interface. The input channels are ac-coupled through C1. C4 and C5 provide bypassing for the center taps of the RF input baluns. | C1 = 3 pF (Size 0402), C4 = 10 pF (Size 0402), C5 = 0.01 μF (Size 0402) |
| T1, R1, C24, C25 | IF Output Interface. T1 is a 1:1 impedance transformer that provides a single-ended IF output interface. Remove R1 for balanced output operation. C24 and C25 block the dc bias at the IF ports. | T1 = TC1-1-13M+ (Mini-Circuits), R1 = 0 Ω (Size 0402), C24, C25 = 560 pF (Size 0402) |
| C10, C12, R4 | LO Interface. C10 and C12 provide ac coupling for the LO1_IN and LO2_IN local oscillator inputs. LOSEL selects the appropriate LO input for both mixer cores. R4 provides a pull-down to ensure that LO1_IN is enabled when the LOSEL test point is logic low. LO2_IN is enabled when LOSEL is pulled to logic high. | C10, C12 = 22 pF (Size 0402), R4 = 10 k Ω (Size 0402) |
| R21 | PWDN Interface. R21 pulls the PWDN logic low and enables the device. The PWR_UP test point allows the PWDN interface to be exercised using an external logic generator. Grounding the PWDN pin for nominal operation is allowed. Using the PWDN pin when supply voltages exceed 3.3 V is not allowed. | R21 = 10 k Ω (Size 0402) |
| C22, L3, R9, R14, R22, R23, VGS0, VGS1 | Bias Control. R22 and R23 form a voltage divider to provide 3 V for logic control, bypassed to ground through C22. VGS0 and VGS1 jumpers provide programmability at the VGS0 and VGS1 pins. It is recommended to pull these two pins to ground for nominal operation. R9 sets the bias point for the internal LO buffers. R14 sets the bias point for the internal IF amplifier. | C22 = 1 nF (Size 0402), L3 = 0 Ω (Size 0603), R9 = 1.7 k Ω (Size 0402), R14 = 0 Ω (Size 0402), R22 = 10 k Ω (Size 0402), R23 = 15 k Ω (Size 0402), VGS0 = VGS1 = 3-pin shunt |
