## AB2726B 27mm Piezoelectric Bender

The piezo ceramic diaphragm shall be clamped at a nodal point as shown in the figure above and be free from any mechanical stress. The resonant frequency and resonant impedance is measured using sine sweep analysis. The resonant frequency is defined where the impedance shows minimum value; this shall also be the resonant impedance.

Capacitance is measured at 120 Hz using an LCR meter such as a Hewlett Packard HP49194A.

### Nodal Mounting

Mounting typically occurs at 60% of the overall diameter of the piezo bender's brass or steel plate. Usually the same diameter as the piezo ceramic element.

Higher output than Edge Mounting with reduced frequency response bandwidth (i.e. single tone).

### Edge Mounting

Mounting typically occurs at 1mm inside the outside edge of the bender's brass or steel plate.

Wider frequency response than Nodal Mounting while sacrificing maximum output.
