

DESCRIPTION

Demonstration circuit DC890B along with PScope™ software provides a USB based Windows PC hosted digital data acquisition system supporting CMOS/LVDS output ADCs up to 250Mps. The DC890B must be powered from an external 6VDC ± 0.5 VDC power supply when operating in LVDS mode. When operating in CMOS mode, the external power supply is optional. The Linear Technology supplied PScope evaluation software automatically detects the DC890B and can also detect many of the standard ADC demonstration circuits boards. *The DC890B will not enable LVDS mode unless an external 6.0VDC power source is available.* This system provides for fast and easy performance evaluation of high speed ADCs. DC890B collects up to 256K word samples and then performs

various analyses on the data including calculating SNR, SINAD, THD, SFDR and ENOB. The digitized input, an FFT of the collected data, the primitive wave of the sample set or an IFFT of modified frequency domain data is plotted to a display window to facilitate analyzing distortion products and sources. Figure 1 shows a picture of the DC890B. The DC890B is connected to the ADC demonstration circuit via a 100-pin edge connector, to the PC by a USB A-B cable and to an optional power supply either by a 5mm power plug or optionally by turrets. Figure 2 details the connections.

Design files for this circuit board are available at <http://www.linear.com/demo>

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks and PScope is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

BOARD PHOTO

Figure 1. DC890B Board

OPERATING PRINCIPLES

The DC890B is capable of collecting a block of data samples from an ADC demonstration circuit initiated either by an internally generated trigger or an externally supplied 2.5V CMOS level trigger of user selected edge. The external trigger is TTL or CMOS compatible (the trigger line is diode clamped to the 2.5V Rail through a 475Ω resistor).

Refer to the PScope software help for information on the various operating modes and options. The conversion clock to the DC890B is supplied via the ADC demonstration circuit either from an optional on board oscillator if installed or an external signal generator connected to the ADC demonstration circuit.

QUICK START PROCEDURE

To prevent damage to the DC890B, it is important to follow the equipment setup procedure outlined below:

1. Do not plug the DC890B into the PC USB port before running the installation program
2. Download the PScope installation program from <http://www.linear.com/software/>.
3. Run the PScope installation program and follow the on-screen instructions.

NOTE: The PScope evaluation software requires a PC running Windows98, 2000, XP, or later, with an available USB port.

4. Connect the DC890B to the USB port and supply external power to the DC890B, if you will be using the LVDS mode. Do not use a USB cable longer than 2m or the board may not reset properly. (See note in Trouble Shooting section.)
5. Connect only 2.5V CMOS or LVDS output ADC demonstration circuits directly to the DC890B via the 100 pin edge connector. All Linear Technology DC890 compatible demo boards meet these requirements. Apply DC power to the ADC demonstration circuit.
6. Each ADC demonstration board also comes with a quick start guide similar to this one and should be referred to for specific usage details relevant to the demonstration

circuit being evaluated. Please refer to it for proper jumper settings, input power requirements and input signal levels and frequency ranges.

7. Apply an appropriate conversion clock and analog input signal to the ADC demonstration board.
8. ADC board will be automatically detected and configured.
9. Select processing options (the hammer icon) menu and verify that under trigger mode, no trigger wait is selected
10. Enter the exact sample rate in MHz and select the sample size in the provided fields in PScope page 1.

NOTE: Minimum sample rate in LVDS mode is 50MSPS.

11. If the sampled signal is not coherent with the encode clock, select an appropriate windowing function from the pull down menu.
12. Initiate a data collection cycle by clicking the green collect button; it will turn red during the collection cycle. An FFT should appear on the screen along with a plot of the sampled data. Make sure the input level is not over ranging the ADC. See online help for specific guidance on using the PScope software.

QUICK START PROCEDURE

Figure 2. DC890B Basic Connection Locations

USEFUL SOFTWARE TOOLS

The PScope software includes tools for automatic software updates and for quickly retrieving documentation from the world wide web.

NOTE: Adobe Acrobat Reader is required to view the documents and is available at <http://www.adobe.com>.

To update the PScope software (requires an internet connection):

- Choose Update Program from the tools menu.

This automatically updates the main program and drivers for individual demo circuits.

OPTIONAL CONNECTIONS TO THE DC890B

- In CMOS mode the DC890B can operate from the USB power, however in LVDS mode, the Spartan-III FPGA IO ring drivers draw considerable supply current to bias the active LVDS terminations. The DC890B has provisions for a 5mm power plug for an external $6V \pm 0.5V$ supply. The DC890B automatically detects the presence of external power and disables the USB power input.
- X1: The DC890B has provisions for an external trigger input, edge selectable by software. This permits initiating data block capture by an external event.
- J2: A JTAG connector is provided for downloading custom FPGA software to the board. Grounding pin 3 of J2 automatically puts the FPGA into JTAG program-

ming mode. User developed code can be loaded into the FPGA without compromising the factory installed code. Jumper pins 4 and 6 of PIC programming connector J1 to disable the microcontroller when using custom FPGA code. Refer to the schematic for further details.

This feature is provided due to customer requests. Development of custom code will not be supported by the factory.

- J7 and J8 locations (not installed) provide access to six additional FPGA pins for test purposes. These pins also drive LED indicators useful for debug purposes. Xilinx provides logic analysis and data collection features through JTAG via ChipScope.

LED INDICATORS

The DC890B provides system status via eight LEDs:

LED-1. TRANSFER – Indicates a USB data transfer from the PScope to the PC is in progress.

LED-2. SEEP – Indicates access of the optional demonstration circuit serial electrically erasable PROM on select demonstration boards. Information in this SEEP permits PScope software to configure the DC890B properly for the device under evaluation using the auto detect demo board feature in the configure/device menu.

LED-3. RST – Indicates assertion of either a hard or soft reset.

LED-4. DCM_RDY– In LVDS mode, LED 4 blinks to alert the user that the sample clock is either not present

or outside the required frequency range (F_{IN} must be > 50 MHz). A steady on condition indicates the digital clock module is locked to the input sample clock. In CMOS mode LED 4 functions as a power-on/FPGA programmed Indicator.

LED-5. RUN ON TRIGGER – Indicates that the board is set to run on trigger (versus halt on trigger mode).

LED-6. DATA_RDY – Indicates completion of data block acquisition.

LED-7. RUN – Indicates the board is ARMED to collect a block of data.

LED-8. TRIGGER – Indicates that a trigger was received and data collection has started.

CIRCUIT DETAILS

A schematic, parts list and parts placement drawings are attached to the end of this quick start guide for reference only.

TROUBLE SHOOTING GUIDE

Problem: DC890B is plugged in, but PScope software still does not recognize DC890B board.

Solution: Assuming that the USB hardware in your computer is operational (try verifying an operational USB port with another USB device such as a USB memory stick, printer or scanner if available.), the likely cause is improper installation of the USB drivers, which results in Windows recognizing the DC890B as an *unknown device*. If this is the case, the problem can be corrected by the following procedure:

- 1) Unplug the DC890B board from the USB port.
- 2) Reinstall the PScope software. **Carefully** following the on-screen instructions. This **may** require a reboot of your computer. The on-screen instructions will inform you if that is the case.
- 3) If the problem persists, please choose *contact software support* from the tools menu for assistance from LTC staff.

Problem: Demonstration circuit software loads properly, but will not run or gives *device not accessible* errors.

Solution: Verify the demonstration circuit is properly powered up and a correct (signal level and frequency) conversion clock is applied. (The DC890B can operate from the USB port power in CMOS mode but will not load the FPGA with the LVDS code unless external power is detected.) Set the correct sample rate for the applied conversion clock as PScope software uses the sample size and rate to determine the watch dog time out period

to reset the DC890B if the USB bus should hang. Refer to the appropriate demonstration circuit quick start guide for details.

Problem: Collected data samples look like noise or appear corrupted.

Solution: Make sure the proper device has been selected in the PScope software, the factory jumper settings are present and for LVDS output demo boards, external power is applied to the DC890B otherwise the captured data will not be properly interpreted.

Problem: PScope reports it cannot reset the DC890B.

Solution: Make sure either a powered USB port is used or external power is supplied. **DO NOT USE A USB CABLE LONGER THAN 2 METERS.** The time delay of a longer USB cable may result in the DC890B intercepting the reset.

Problem: USB Bus appears to be hung.

Solution: As the DC890B is used in a lab environment where power may be inappropriately sequenced, cables unintentionally disconnected etc, some users have reportedly had their USB bus hang. This condition is easily rectified by right clicking properties under my computer ⇒ Hardware ⇒ Device Manager ⇒ and then right clicking on the appropriate USB bus controller and again selecting properties. The device status generally reports that it is working properly. Select the advanced tab. You will notice a refresh button. Device manager has queried the port, and as a result, reset the bus.

DEMO MANUAL DC890B

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
