

DS26F32C/DS26F32M Quad Differential Line Receiver

General Description

The DS26F32 is a quad differential line receiver designed to meet the requirements of EIA Standards RS-422 and RS-423, and Federal Standards 1020 and 1030 for balanced and unbalanced digital data transmission.

The DS26F32 offers improved performance due to the use of state-of-the-art L-FAST bipolar technology. The L-FAST technology allows for higher speeds and lower currents by utilizing extremely short gate delay times. Thus, the DS26F32 features lower power, extended temperature range, and improved specifications.

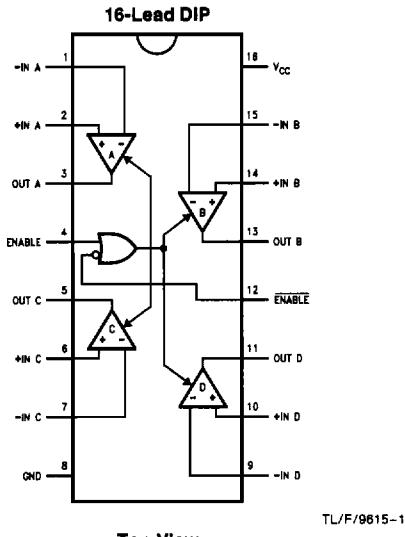

The device features an input sensitivity of 200 mV over the input common mode range of $\pm 7.0\text{V}$. The DS26F32 provides an enable function common to all four receivers and TRI-STATE® outputs with 8.0 mA sink capability. Also, a fail-safe input/output relationship keeps the outputs high when the inputs are open.

The DS26F32 offers optimum performance when used with the DS26F31 Quad Differential Line Driver.

Features

- Military temperature range
- Input voltage range of $\pm 7.0\text{V}$ (differential or common mode) $\pm 0.2\text{V}$ sensitivity over the input voltage range
- Meets all the requirements of EIA standards RS-422 and RS-423
- High input impedance (18k typical)
- 30 mV input hysteresis
- Operation from single +5.0V supply
- Input pull-down resistor prevents output oscillation on unused channels
- TRI-STATE outputs, with choice of complementary enables, for receiving directly onto a data bus
- Propagation delay 15 ns typical

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Electrical Characteristics" provide conditions for actual device operation.

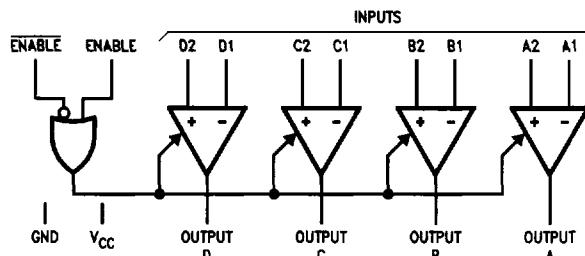

Note 2: Unless otherwise specified min/max limits apply across the -55°C to $+125^{\circ}\text{C}$ temperature range for the DS26F32M and across the 0°C to $+70^{\circ}\text{C}$ range for the DS26F32C. All typicals are given for $V_{CC} = 5\text{V}$ and $T_A = 25^{\circ}\text{C}$.

Note 3: All currents into the device pins are positive; all currents out of the device pins are negative. All voltages are reference to ground unless otherwise specified.

Note 4: Only one output at a time should be shorted.

Switching Characteristics $V_{CC} = 5.0V, T_A = 25^\circ C$
