

## Grove - Barometer Sensor (BMP280)

**Grove - Barometer Sensor (BMP280)** is a breakout board for Bosch BMP280 high-precision and low-power digital barometer. This module can be used to measure **temperature** and **atmospheric pressure** accurately. As the atmospheric pressure changes with altitude, it can also measure approximate **altitude** of a place. It can be connected to a microcontroller with I<sup>2</sup>C (integrated with Grove socket) or through SPI bus. We have also provided highly abstracted library to make this product easier to use.

The BMP280 is an upgraded version of BMP180. BMP280 gets dramatic improvements from BMP180. BMP280 comes with a smaller footprint, lower power consumption, lower noise measurements, higher resolutions for pressure and temperature, lower RMS noise, newly added interface SPI, more measuring modes, higher measuring rate and newly added filter against environmental interference. Since the atmosphere pressure reading is affected by altitude and temperature, we have added compensation features in the library. Hence, Grove - Barometer Sensor (BMP280) would be more reliable in providing precise temperature, atmospheric pressure values and approximate altitude data.

Using the sensor is easy. For [Seeeduino](#) (compliant with Arduino), just connect this breakout board using [Grove cable](#) to I<sup>2</sup>C Grove connector. Then, use the provided library and example code from GitHub. If you are using an Arduino either use Base Shield v2.0 or simply connect the VCC pin to the 5V voltage pin, GND to ground, SCL to I<sup>2</sup>C Clock (Analog 5) and SDA to I<sup>2</sup>C Data (Analog 4).

Typical applications: Enhancement of GPS navigation, outdoor/indoor navigation, weather forecast, or any other project that requires an accurate atmospheric pressure reading.

## Features

- Get more precise temperature, atmospheric pressure values, and approximate altitude data.
- Grove compatible and easy to use
- Highly abstracted library for building projects quicker

### Tip

More details about Grove modules please refer to [Grove System](#)

## Specifications

Parameter	Value
Input voltage	3.3V or 5V
I/O voltage	3.3V or 5V
Operating current	0.6mA
Operating temperature	-40 - 85 °C
Effective pressure measurement range	300 - 1100 hPa (1 hPa= one hundred Pa) with ±1.0 hPa accuracy
Temperature measurement accuracy	±1.0°C
Measurement modes	Piezo & Temperature, forced or periodic
Chip	BMP280 ( <a href="#">datasheet</a> )
Possible sampling rate	182 Hz (typical)
Interface Bus	SPI, I <sup>2</sup> C (use either one of them)
Weight	3 g (for breakout board)
Dimensions	40 (width) × 20 (depth) mm
I2C Address	0x77()default or 0x76

## Notes

1. We will show/describe how to select interface bus soon.
2. The altitude is calculated by a combination of temperature and atmospheric pressure. No specialized components for altitude.

## Platforms supported

Arduino	Raspberry Pi	BeagleBone	Wio	LinkIt ONE
				

## Caution

The platforms mentioned above as supported is/are an indication of the module's software or theoretical compatibility. We only provide software library or code examples for Arduino platform in most cases. It is not possible to provide software library / demo code for all possible MCU platforms. Hence, users have to write their own software library.

## Hardware Overview

- **SPI soldering pads**, a voltage monitoring circuit.
- **Interface bus selection pads**, to select I<sup>2</sup>C bus, connect the two pads by soldering (this is connected by default); to select SPI bus, cut the two pads with a sharp knife or a soldering iron.
- **Slave board address selection pads**, to select slave board address to avoid address collision.

If you have selected I2C bus, the default address for slave board is **0x77**(right-two pads are connected). If you want to use the address **0x76**, connect only left two (disconnect right two) by soldering.

**Tips:** You can disconnect pads with just a sharp knife.

If you have selected SPI bus, the default address for slave board is **0x77**(right-two pads are connected). If you want to use the address **0x76**, disconnect all three pads.

### Note

Do not touch or shake or let this product in vibration when it works. This will cause interference and will affect the accuracy of data collected.

### Package includes (main parts)

Parts name	Quantity
Grove - Barometer Sensor (BMP280)	1 piece
Grove cable	1 piece

## Getting Started

### Play with Arduino

#### Hardware

- **Step 1.** Prepare the below stuffs:

Seeeduino V4.2	Base Shield	Grove-Barometer_Sensor-BMP280
		

- **Step 2.** Connect Grove-Barometer\_Sensor-BMP280 to port **I2C** of Grove-Base Shield.
- **Step 3.** Plug Grove - Base Shield into Seeeduino.
- **Step 4.** Connect Seeeduino to PC via a USB cable.

#### Note

If we don't have Grove Base Shield, We also can directly connect this module to Seeeduino as below.

Seeeduino_v4	Grove-Barometer_Sensor-BMP280
5V	VCC
GND	GND
SDA	SDA
SCL	SCL

## Software

**Step 1.** Download the [library](#) from Github.

**Step 2.** Refer [How to install library](#) to install library for Arduino.

**Step 3.** Create a new Arduino sketch and paste the codes below to it or open the code directly by the path:File -> Example ->bmp280\_example->bmp280\_example

Here is the code:

```

1/*
2 * bmp280_example.ino
3 * Example sketch for BMP280
4 *

29 * THE SOFTWARE.
30 */

```

```

31#include "Seeed_BMP280.h"
32#include <Wire.h>
33
34BMP280 bmp280;
35
36void setup()
37{
38  Serial.begin(9600);
39  if(!bmp280.init()){
40    Serial.println("Device error!");
41  }
42}
43
44void loop()
45{
46  float pressure;
47
48  //get and print temperatures
49  Serial.print("Temp: ");
50  Serial.print(bmp280.getTemperature());
51  Serial.println("C"); // The unit for Celsius because original arduino don't support special symbols
52
53  //get and print atmospheric pressure data
54  Serial.print("Pressure: ");
55  Serial.print(pressure = bmp280.getPressure());
56  Serial.println("Pa");
57
58  //get and print altitude data
59  Serial.print("Altitude: ");
60  Serial.print(bmp280.calcAltitude(pressure));
61  Serial.println("m");
62
63  Serial.println("\n");//add a line between output of different times.
64
65  delay(1000);
66}

```

**Step 4.** Upload the code. If you do not know how to upload the code, please check [how to upload code](#).

**Step 5.** Open the serial monitor to receive the sensor's data including temperature, barometric pressure value, and altitude.
