Description

The IR 3311(S) is a Fully Protected 4 terminal high side switch. The input signal is referenced to Vcc. When the input voltage Vcc - Vin is higher than the specified Vih threshold, the output power MOSFET is turned-on. When Vcc - Vin is lower than the specified Vil threshold, the output MOSFET is turned-off. A sense current proportional to the current in the power Mosfet is sourced to the Ifb pin. Over-current shutdown occurs when Vifb - Vin > 4.5 V. The current shutdown threshold is adjusted by selecting the proper RIfb. Either over-current and over-temperature latches off the switch. The device is reset by pulling the input pin high. Other integrated protections (ESD, reverse battery, active clamp) make the IR3311(S) very rugged and suitable for the automotive environment.

1) Limited by junction temperature. Pulsed current is also limited by wiring

2) <500 Ohm or shorting Ifb to gnd may damage the part with Ids around 90A

3) >5000 Ohm or leaving Ifb open will shutdown the part. No current will flow in the load.
