FEATURES

- Input Power Voltage: 12V ± 1V
- Input Current Range: 150mA to 720mA
- Output Voltage: 0 to 6kV@CTRL = 0 to 5V
- Constant Output Current: 1mA
- Reference Voltage: 5V ± 0.05V
- Input Control Voltage: 0 to 5V
- Electronic Shutdown Control Available
- Zero EMIs and Good Heat Sinking by Metal Enclosure

APPLICATIONS

This power module, ACCHV12V6KV1MAW, is designed for achieving DC-DC conversion from low voltage to high voltage as a power supply source. It can be used for:

- Charge capacitors
- X-ray Machine
- Spectral Analysis
- Nondestructive Inspection
- Semiconductor Manufacturing Equipment
- Particle Accelerator
- Capillary Electrophoresis
- Particles Injection
- Physical Vapor Phase Deposition
- Electrospinning Preparation of Nanofiber
- DC Reactive Magnetron Sputtering

Table 1. Pin Names, Colors, Functions and Specifications.

No.	Name	Description	Type	Color	Min.	Typ.	Max.
1	SDN	Shutdown logic low	Digital input	Blue	0V		0.8V
		Shutdown logic high			1.2V		5V
2	5VR	Reference voltage	Analog output	Yellow		5V	
3	CTRL	Regulation	Analog input	White	0V		5V
4	VPS	Input voltage	Power supply input	Red	11V	12V	13V
5	GND	Ground	Ground for power supply and analog & digital signals	Black		0V	
6	VOUT	Output high voltage	Power output	Brown	0V		6kV

DESCRIPTION

Figure 1 shows the actual pictures of ACCHV12V6KV1MAW. Figure 2 shows its connecting wires. More detail information is given in Table 1. The high voltage output can be set to a constant value between 0V to 6kV by connecting the CTRL port to the central tap of a POT (Potentiometer) or modulated by an AC signal ranging from 0V to 5V, as see Figure 3 and Figure 4 respectively. The output voltage equals to 1000 times the input control voltage: $V_{VOUT}=1000 \times V_{CTRL}$.

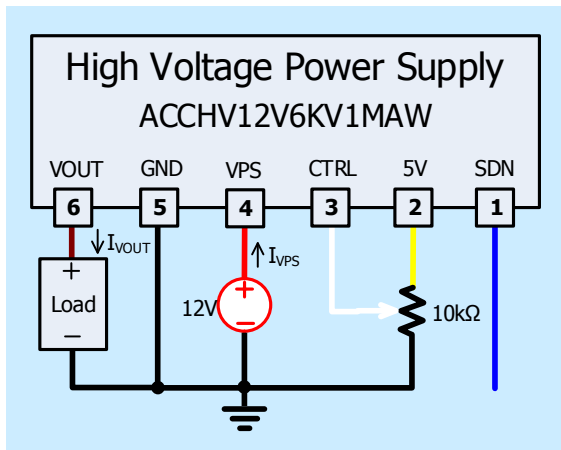

Figure 3. Setting Output to be a Constant Voltage

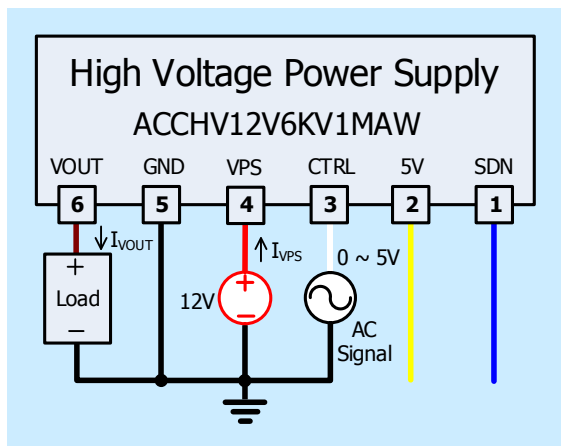

Figure 4. Modulating Output by an AC Signal Source

Please note that the modulation signal must have a low frequency $\leq 10\text{Hz}$ and the value range must be $0\text{V} \leq V_{CTRL} \leq 5\text{V}$. The equivalent input circuit for the CTRL is shown in Figure 5.

Figure 5. The Equivalent Circuit for CTRL Port

To shutdown ACCHV12V6KV1MAW, pull down SDN pin to $<0.8\text{V}$; to turn it on, leave SDN pin unconnected or pull it $>1.2\text{V}$. The maximum voltage allowed on the SDN pin is 5V. The equivalent circuit for SDN port is shown in Figure 6.

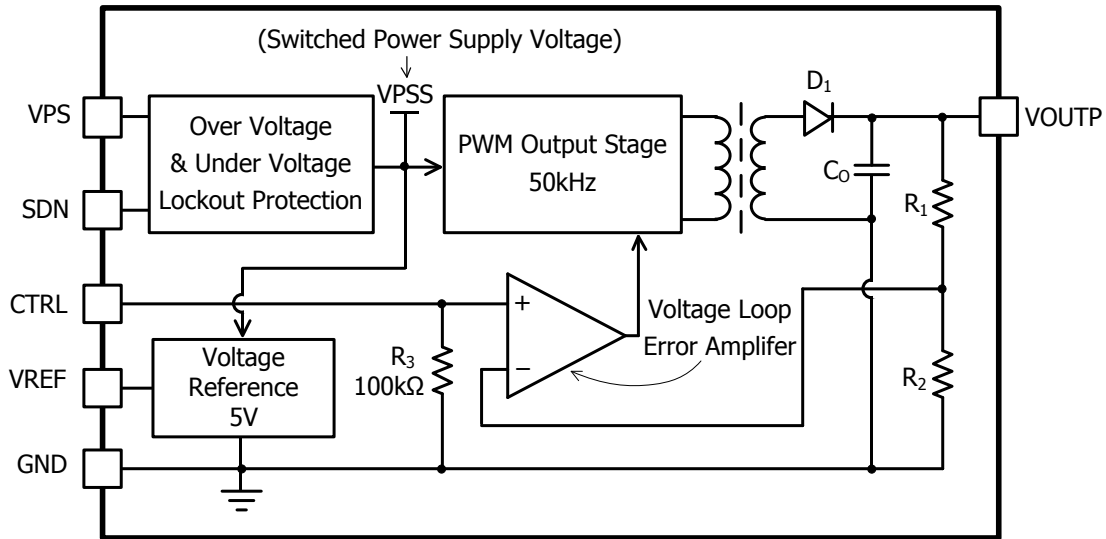

Figure 6. The Equivalent Circuit for SDN Port

USING ACCHV12V6KV1MAW

This high voltage power supply must be mounted tightly onto a metal plate, ideally, thus expanding its heating sinking capacity of the metal enclosure. Sufficient ventilation must be provided to keep the power supply surface temperature under 55°C .

SAFETY PRECAUTIONS

Although ACCHV12V6KV1MAW high voltage power supply comes with an over current protection circuit, a short circuit at the output should always be avoided. Make sure the high voltage wire for connecting VOUT node has sufficient insulation capability with its surrounding objects.

$V_{OUTP} = N \times V_{CTRL}$, where N is the amplification factor: $N = R_1/R_2$.

TESTING DATA

Test conditions: $V_{PS} = 12V$, $T_A = 25^{\circ}C$, $R_{LOAD} = 6M\Omega$

DC Testing

The measured output voltage, V_{OUT} , corresponding to the control port input voltage, V_{CTRL} , is shown in Figure 7.

Figure 7. V_{CTRL} vs. V_{OUT}

Charging Testing

It takes 6 seconds to charge a $1\mu F$ capacitor by using 6kV voltage and 1mA constant current. We can also customize high voltage power supply based on users' requirements.

Figure 8. Charging Curve

AC Testing

To test the analog modulation function, a triangle and sine-wave voltage signals are applied to the CTRL port as the input source signal respectively. Figure 9 and 10 show both the input signal and the output signal waveforms when using the triangle and sine-wave signals at the CTRL port respectively.

Figure 9. Triangle Wave Modulation

Figure 10. Input vs. Sine Wave Modulation

To test the rise and fall times at the output, a step function signal is applied to the CTRL port. The testing results are shown in Figure 11, Figure 12, and Figure 13. As shown in Figure 12 and Figure 13, a square wave of 0.25V ~ 5V, f = 0.10Hz, is applied to CTRL port, the output waveform fall time is measured to be about 100ms and the rise time is about 30ms. These two values are not the same, that is because on the rising trail, the power supply injects a current to the load; while on the falling trail, the best the power supply can do is to stop its output current and let the load resistor drain the output filtering capacitor to a lower voltage, and the draining current is much smaller than the injection current.
