

## ADG506A/ADG507A

### FEATURES

- 44 V Supply Maximum Rating
- $V_{SS}$  to  $V_{DD}$  Analog Signal Range
- Single/Dual Supply Specifications
- Wide Supply Ranges (10.8 V to 16.5 V)
- Extended Plastic Temperature Range  
( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ )
- Low Power Dissipation (28 mW max)
- Low Leakage (20 pA typ)
- Available in 28-Lead DIP, SOIC, PLCC, TSSOP and LCCC Packages
- Superior Alternative to:  
DG506A, HI-506  
DG507A, HI-507

### FUNCTIONAL BLOCK DIAGRAM

### GENERAL DESCRIPTION

The ADG506A and ADG507A are CMOS monolithic analog multiplexers with 16 channels and dual 8 channels, respectively. The ADG506A switches one of 16 inputs to a common output, depending on the state of four binary addresses and an enable input. The ADG507A switches one of eight differential inputs to a common differential output, depending on the state of three binary addresses and an enable input. Both devices have TTL and 5 V CMOS logic compatible digital inputs.

The ADG506A and ADG507A are designed on an enhanced  $\text{LC}^2\text{MOS}$  process, which gives an increased signal capability of  $V_{SS}$  to  $V_{DD}$  and enables operation over a wide range of supply voltages. The devices can operate comfortably anywhere in the 10.8 V to 16.5 V single or dual supply range. These multiplexers also feature high switching speeds and low  $R_{ON}$ .

### PRODUCT HIGHLIGHTS

1. Single/Dual Supply Specifications with a Wide Tolerance  
The devices are specified in the 10.8 V to 16.5 V range for both single and dual supplies.
2. Extended Signal Range  
The enhanced  $\text{LC}^2\text{MOS}$  processing results in a high break-down and an increased analog signal range of  $V_{SS}$  to  $V_{DD}$ .
3. Break-Before-Make Switching  
Switches are guaranteed break-before-make so input signals are protected against momentary shorting.
4. Low Leakage  
Leakage currents in the range of 20 pA make these multiplexers suitable for high precision circuits.

## NOTES

<sup>1</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

<sup>2</sup>Overvoltage at A, EN, S or D will be clamped by diodes. Current should be limited to the Maximum Rating above.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG506A/ADG507A feature proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## SINGLE SUPPLY AUTOMOTIVE APPLICATION

The excellent performance of the multiplexers under single supply conditions makes the ADG506A/ADG507A suitable in applications such as automotive and disc drives where only positive power supply voltages are normally available. The following application circuit shows the ADG507A connected as an 8-channel differential multiplexer in an automotive, data acquisition application circuit.

The AD7580 is a 10-bit successive approximation ADC, which has an on-chip sample-and-hold amplifier and provides a conversion result in 20  $\mu$ s. The ADC has differential analog inputs and is configured in the application circuit for a span of 2.5 V over a common-mode range 0 V to +5 V. Wider common-mode ranges can be accommodated. See the AD7579/AD7580 data sheet for more details. The complete system operates from +12 V (+10%) and +5 V supplies. The analog input signals to the ADG507A contain information such as temperature, pressure, speed etc.
