

SKYWOR[®]KS

AGB3301

50Ω High Linearity Low Noise
Wideband Gain Block
Data Sheet

FEATURES

- 250 - 3000 MHz Frequency Range
- +45 dBm Output IP3
- Low Noise Figure: 2.4 dB at 900 MHz
- 13.5 dB Gain at 900 MHz
- +24 dBm P1dB
- SOT-89 Package
- Single +5V to +9V Supply
- Low Power: less than 1 Watt
- Case Temperature: -40 to +100 °C
- RoHS Compliant Package, 260 °C MSL-2

APPLICATIONS

- Cellular Base Stations for W-CDMA, CDMA, TDMA, GSM, PCS and CDPD systems
- Fixed Wireless
- MMDS/WLL
- WLAN, HyperLAN
- CATV

**S24 Package
SOT-89**

PRODUCT DESCRIPTION

The AGB3301 is one of a series of GaAs MESFET amplifiers designed for use in applications requiring high linearity, low noise and low distortion. With a high output IP3, low noise figure and wide band operation, the AGB3301 is ideal for 50Ω wireless

infrastructure applications such as Cellular Base Stations, MMDS, and WLL. Offered in a low cost SOT-89 surface mount package, the AGB3301 requires a single +5V to +9V supply, and typically consumes less than 1 Watt of power.

Figure 1: Block Diagram

Figure 2: Pin Out

Table 1: Pin Description

PIN	NAME	DESCRIPTION
1	RF _{IN}	RF Input
2	GND	Ground
3	RF _{OUT}	RF Output / Bias
4	GND	Ground

ELECTRICAL CHARACTERISTICS

Table 2: Absolute Minimum and Maximum Ratings

PARAMETER	MIN	MAX	UNIT
Device Voltage	0	+12	VDC
RF Input Power	-	+15	dBm
Storage Temperature	-40	+150	°C
Channel Temperature	-	+150	°C

Stresses in excess of the absolute ratings may cause permanent damage. Functional operation is not implied under these conditions. Exposure to absolute ratings for extended periods of time may adversely affect reliability.

Table 3: Operating Ranges

PARAMETER	MIN	TYP	MAX	UNIT
Operating Frequency: f	250	-	3000	MHz
Device Voltage: V _{DD}	-	+9	+10	VDC
Case Temperature: T _c	-40	-	+100	°C

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

Table 4: Electrical Specifications - Unmatched 50Ω Test Circuit
 (T_A = +25 °C, V_{DD} = +9 VDC, f = 900 MHz, see Figure 3)

PARAMETER	MIN	TYP	MAX	UNIT
Gain: S ₂₁	12	13.5	15	dB
Input Return Loss: S ₁₁	-	-15	-10	dB
Output Return Loss: S ₂₂	-	-15	-10	dB
Output IP ₃ ⁽¹⁾	+42	+45	-	dBm
Noise Figure	-	2.4	3.5	dB
Output 1dB Compression: P _{1dB}	-	+24	-	dBm
Thermal Resistance: θ _{Jc}	-	-	40	°C/W
Supply Current	90	110	130	mA

Notes:

(1) OIP₃ is measured with two tones: 900 MHz and 901 MHz, +5dBm output per tone.

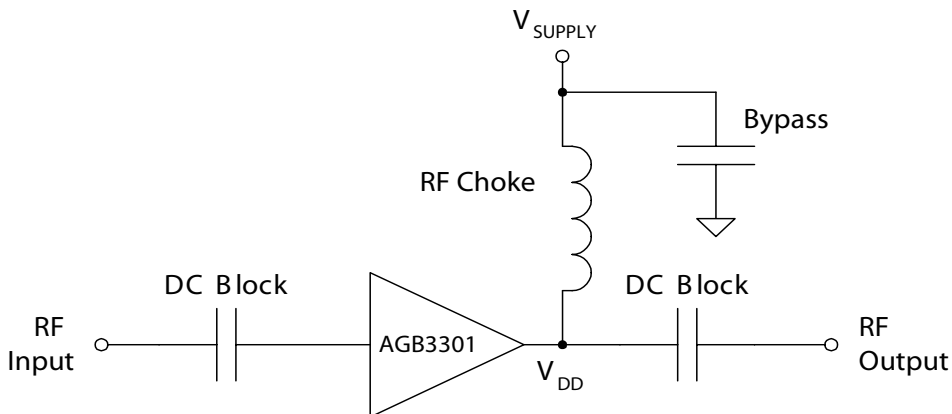

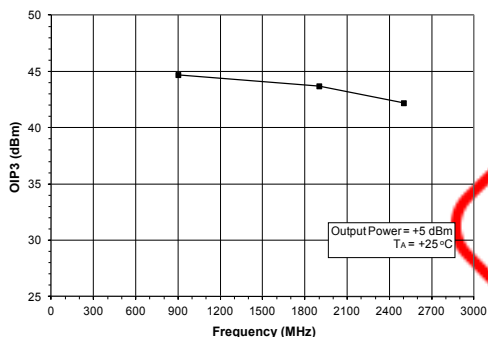

Figure 3: Unmatched 50Ω Test Circuit

PERFORMANCE DATA

Figures 4 through 8 contain data for the device as tested in the unmatched 50Ω test circuit shown in Figure 3. Unless otherwise indicated, $V_{DD} = +9$ VDC.

Bias Circuit

A schematic of the basic, unmatched bias circuit for the AGB Series Gain Blocks is shown in Figure 33. The RF input and output terminations are 50Ω . Inductor L1 provides DC power from V_{SUPPLY} and serves as an RF choke to maintain desired AC performance. The input capacitor C1 and output capacitor C2 are RF blocks that isolate DC current from adjacent circuits. Capacitor C3 is used as an RF bypass that minimizes noise from the supply.

In some applications, a feedback resistor R1 may be added in series with L1, as shown in Figure 34, for improved stability or to serve as a voltage drop for operation from higher supply voltages.

Matching for RF Performance

The AGB3301 Gain Block amplifier can be used in many fixed wireless frequency bands, such as the 824-894 MHz U.S. cellular bands, the 1850-1990 MHz PCS band, the 880-960 MHz GSM band, the 2400-2500 MHz ISM band, and the 2500-2686 MHz MMDS band. Reactive matching circuits may be designed for

Figure 36: Unmatched Bias Circuit

Figure 37: Bias Circuit with Optional Feedback/Voltage Drop Resistor

both the input and output, in order to optimize the RF performance for a particular application. For example, gain, linearity (OIP3) and return loss may be improved over a particular frequency band of interest.

Recommended matching circuits for various applications, as well as wideband S-parameters to use in the simulation of custom designs, are included in this data sheet. For a particular application not addressed in the data sheet, please consult with a company Sales Representative or Application Engineer.

Evaluation Boards

A versatile evaluation board that enables users to measure actual device performance has been developed for the AGB Series Gain Blocks. The generic layout allows the user to implement a wide variety of matching circuits, in order to assess performance for a particular application.

The evaluation board is 1.0" square, and is fabricated on 0.031" thick FR-4 material. Figures 35 and 36 show the via hole locations and the layout pattern on both sides of the evaluation board. The vias have a 0.010" diameter and are plated through.

To request an evaluation board, please contact a company Sales Representative or Application Engineer.

ESD Sensitivity

Electrostatic discharges can cause permanent damage to this device. Electrostatic discharges accumulate on test equipment and the human body, and can discharge without detection. Although the AGB3301 has some internal ESD protection, proper precautions and handling are strongly recommended. Refer to the application note on ESD precautions.

S-Parameter Data

Table 11 depicts the raw Magnitude and Angle data for an unmatched AGB3301 over the 50 to 3000 MHz frequency range of operation. Data is shown in 100 MHz steps, with a characteristic impedance of 50 Ohms, $V_{DD} = +9\text{ V}$, and at $T_A = +25\text{ }^\circ\text{C}$.
