5 kV, 7-Channel, SPIsolator Digital Isolators for SPI

Data Sheet

ADuM4151/ADuM4152/ADuM4153

FEATURES

- Supports up to 17 MHz SPI clock speed
- 4 high speed, low propagation delay, SPI signal isolation channels
- Three 250 kbps data channels
- 20-lead SOIC_IC package with 8.3 mm creepage
- High temperature operation: 125°C
- High common-mode transient immunity: >25 kV/µs
- Safety and regulatory approvals
  - UL recognition per UL 1577
    - 5000 V rms for 1 minute SOIC long package
  - CSA Component Acceptance Notice 5A
  - VDE certificate of conformity
    - DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
    - Maximum working insulation voltage (V_{IORM}): 849 V peak

APPLICATIONS

- Industrial programmable logic controllers (PLCs)
- Sensor isolation

GENERAL DESCRIPTION

The ADuM4151/ADuM4152/ADuM4153[1] are 7-channel, SPIsolator™ digital isolators optimized for isolated serial peripheral interfaces (SPIs). Based on the Analog Devices, Inc., *i*Coupler® chip scale transformer technology, the low propagation delay in the CLK, MO/SI, MI/SO, and $\overline{SS}$ SPI bus signals supports SPI clock rates of up to 17 MHz. These channels operate with 14 ns propagation delay and 1 ns jitter to optimize timing for SPI.

The ADuM4151/ADuM4152/ADuM4153 isolators also provide three additional independent low data rate isolation channels in three different channel direction combinations. Data in the slow channels is sampled and serialized for a 250 kbps data rate with up to 2.5 µs of jitter in the low speed channels.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION

All typical specifications are at T_A = 25°C and V_{DD1} = V_{DD2} = 5 V. Minimum and maximum specifications apply over the entire recommended operation range: 4.5 V ≤ V_{DD1} ≤ 5.5 V, 4.5 V ≤ V_{DD2} ≤ 5.5 V, and −40°C ≤ T_A ≤ +125°C, unless otherwise noted. Switching specifications are tested with C_L = 15 pF and CMOS signal levels, unless otherwise noted.

Table 1. Switching Specifications

		A Grade			B Grade				
Parameter	**Symbol**	**Min**	**Typ**	**Max**	**Min**	**Typ**	**Max**	**Unit**	**Test Conditions/Comments**
MCLK, MO, SO									
SPI Clock Rate	SPI_{MCLK}			1			17	MHz	
Data Rate Fast (MO, SO)	DR_{FAST}			2			34	Mbps	Within PWD limit
Propagation Delay	t_{PHL}, t_{PLH}			25		12	14	ns	50% input to 50% output
Pulse Width	PW	100			12.5			ns	Within PWD limit
Pulse Width Distortion	PWD			3			2	ns	$\lvert t_{PLH} - t_{PHL} \rvert$
Codirectional Channel Matching[1]	t_{PSKCD}			3			2	ns	
Jitter, High Speed	J_{HS}		1			1		ns	
$\overline{MSS}$									
Data Rate Fast	DR_{FAST}			2			34	Mbps	Within PWD limit
Propagation Delay	t_{PHL}, t_{PLH}		21	25		21	25	ns	50% input to 50% output
Pulse Width	PW	100			12.5			ns	Within PWD limit
Pulse Width Distortion	PWD			3			3	ns	$\lvert t_{PLH} - t_{PHL} \rvert$
Setup Time[2]	$\overline{MSS}_{SETUP}$	1.5			10			ns	
Jitter, High Speed	J_{HS}		1			1		ns	
V_{IA}, V_{IB}, V_{IC}									
Data Rate Slow	DR_{SLOW}			250			250	kbps	Within PWD limit
Propagation Delay	t_{PHL}, t_{PLH}	0.1		2.6	0.1		2.6	µs	50% input to 50% output
Pulse Width	PW	4			4			µs	Within PWD limit
Jitter, Low Speed	J_{LS}			2.5			2.5	µs	
V_{Ix}[3] Minimum Input Skew[4]	$t_{VIx\ SKEW}$[3]	10			10			ns	

[1] Codirectional channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier.
[2] The $\overline{MSS}$ signal is glitch filtered in both speed grades, whereas the other fast signals are not glitch filtered in the B grade. To guarantee that $\overline{MSS}$ reaches the output ahead of another fast signal, set up $\overline{MSS}$ prior to the competing signal by different times depending on speed grade.
[3] V_{Ix} = V_{IA}, V_{IB}, or V_{IC}.
[4] An internal asynchronous clock not available to users samples the low speed signals. If edge sequence in codirectional channels is critical to the end application, the leading pulse must be at least 1 $t_{VIx\ SKEW}$ time ahead of a later pulse to guarantee the correct order or simultaneous arrival at the output.

Table 3. For All Models[1, 2, 3]

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
DC SPECIFICATIONS						
MCLK, $\overline{MSS}$, MO, SO, V_{IA}, V_{IB}, V_{IC}						
Logic High Input Threshold	V_{IH}	$0.7 \times V_{DDx}$			V	
Logic Low Input Threshold	V_{IL}			$0.3 \times V_{DDx}$	V	
Input Hysteresis	V_{IHYST}		500		mV	
Input Current per Channel	I_I	−1	+0.01	+1	µA	$0 V \le V_{INPUT} \le V_{DDx}$
SCLK, $\overline{SSS}$, MI, SI, V_{OA}, V_{OB}, V_{OC}						
Logic High Output Voltages	V_{OH}	$V_{DDx} - 0.1$	5.0		V	$I_{OUTPUT} = -20$ µA, $V_{INPUT} = V_{IH}$
		$V_{DDx} - 0.4$	4.8		V	$I_{OUTPUT} = -4$ mA, $V_{INPUT} = V_{IH}$
Logic Low Output Voltages	V_{OL}		0.0	0.1	V	$I_{OUTPUT} = 20$ µA, $V_{INPUT} = V_{IL}$
			0.2	0.4	V	$I_{OUTPUT} = 4$ mA, $V_{INPUT} = V_{IL}$
V_{DD1}, V_{DD2} Undervoltage Lockout	UVLO		2.6		V	
Supply Current per High Speed Channel						
Dynamic Input Supply Current	$I_{DDI(D)}$		0.080		mA/Mbps	
Dynamic Output Supply Current	$I_{DDO(D)}$		0.046		mA/Mbps	
Supply Current for All Low Speed Channels						
Quiescent Side 1 Current	$I_{DD1(Q)}$		4.3		mA	
Quiescent Side 2 Current	$I_{DD2Q)}$		6.1		mA	
AC SPECIFICATIONS						
Output Rise/Fall Time	t_R/t_F		2.5		ns	10% to 90%
Common-Mode Transient Immunity[4]	|CM|	25	35		kV/µs	$V_{INPUT} = V_{DDx}$, $V_{CM} = 1000$ V, transient magnitude = 800 V

[1] $V_{DDx} = V_{DD1}$ or V_{DD2}.
[2] V_{INPUT} is the input voltage of any of the MCLK, $\overline{MSS}$, MO, SO, V_{IA}, V_{IB}, or V_{IC} pins.
[3] I_{OUTPUT} is the output current of any of the SCLK, $\overline{SSS}$, MI, SI, V_{OA}, V_{OB}, or V_{OC} pins.
[4] |CM| is the maximum common-mode voltage slew rate that can be sustained while maintaining output voltages within the V_{OH} and V_{OL} limits. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All typical specifications are at T_A = 25°C and V_{DD1} = V_{DD2} = 3.3 V. Minimum and maximum specifications apply over the entire recommended operation range: 3.0 V ≤ V_{DD1} ≤ 3.6 V, 3.0 V ≤ V_{DD2} ≤ 3.6 V, and −40°C ≤ T_A ≤ +125°C, unless otherwise noted. Switching specifications are tested with C_L =15 pF and CMOS signal levels, unless otherwise noted.

Table 4. Switching Specifications

If edge sequence in codirectional channels is critical to the end application, the leading pulse must be at least 1 $t_{VIx\ SKEW}$ time ahead of a later pulse to guarantee the correct order or simultaneous arrival at the output.

Table 12. For All Models[1, 2, 3]

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
DC SPECIFICATIONS						
MCLK, $\overline{MSS}$, MO, SO, V_{IA}, V_{IB}, V_{IC}						
Logic High Input Threshold	V_{IH}	$0.7 \times V_{DDx}$			V	
Logic Low Input Threshold	V_{IL}			$0.3 \times V_{DDx}$	V	
Input Hysteresis	V_{IHYST}		500		mV	
Input Current per Channel	I_I	−1	+0.01	+1	µA	$0 V \le V_{INPUT} \le V_{DDx}$
SCLK, $\overline{SSS}$, MI, SI, V_{OA}, V_{OB}, V_{OC}						
Logic High Output Voltages	V_{OH}	$V_{DDx} - 0.1$	V_{DDX}		V	$I_{OUTPUT} = -20$ µA, $V_{INPUT} = V_{IH}$
		$V_{DDx} - 0.4$	$V_{DDX} - 2.0$		V	$I_{OUTPUT} = -4$ mA, $V_{INPUT} = V_{IH}$
Logic Low Output Voltages	V_{OL}		0.0	0.1	V	$I_{OUTPUT} = 20$ µA, $V_{INPUT} = V_{IL}$
			0.2	0.4	V	$I_{OUTPUT} = 4$ mA, $V_{INPUT} = V_{IL}$
V_{DD1}, V_{DD2} Undervoltage Lockout	UVLO		2.6		V	
Supply Current for All Low Speed Channels						
Quiescent Side 1 Current	$I_{DD1(Q)}$		2.9		mA	
Quiescent Side 2 Current	$I_{DD2Q)}$		6.1		mA	
AC SPECIFICATIONS						
Output Rise/Fall Time	t_R/t_F		2.5		ns	10% to 90%
Common-Mode Transient Immunity[4]	|CM|	25	35		kV/µs	$V_{INPUT} = V_{DDX}$, $V_{CM} = 1000$ V, transient magnitude = 800 V

[1] $V_{DDx} = V_{DD1}$ or V_{DD2}.
[2] V_{INPUT} is the input voltage of any of the MCLK, $\overline{MSS}$, MO, SO, V_{IA}, V_{IB}, V_{IC} pins.
[3] I_{OUTPUT} is the output current of any of the SCLK, $\overline{SSS}$, MI, SI, V_{OA}, V_{OB}, V_{OC} pins.
[4] |CM| is the maximum common-mode voltage slew rate that can be sustained while maintaining output voltages within the V_{OH} and V_{OL} limits. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

PACKAGE CHARACTERISTICS

Table 13.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Resistance (Input to Output)[1]	R_{I-O}		10^{12}		Ω	
Capacitance (Input to Output)[1]	C_{I-O}		1.0		pF	f = 1 MHz
Input Capacitance[2]	C_I		4.0		pF	
IC Junction to Ambient Thermal Resistance	θ_{JA}		46		°C/W	Thermocouple located at center of package underside

[1] The device is considered a 2-terminal device: Pin 1 through Pin 10 are shorted together, and Pin 11 through Pin 20 are shorted together.
[2] Input capacitance is from any input data pin to ground.

REGULATORY INFORMATION

The ADuM4151/ADuM4152/ADuM4153 are approved by the organizations listed in Table 14. See Table 19 and the Insulation Lifetime section for the recommended maximum working voltages for specific cross isolation waveforms and insulation levels.

Table 14.

RECOMMENDED OPERATING CONDITIONS

Table 17.

Parameter	Symbol	Value
Operating Temperature Range	T_A	−40°C to +125°C
Supply Voltage Range[1]	V_{DD1}, V_{DD2}	3.0 V to 5.5 V
Input Signal Rise and Fall Times		1.0 ms

[1] See the DC Correctness and Magnetic Field Immunity section for information on the immunity to the external magnetic fields.

ABSOLUTE MAXIMUM RATINGS

T_A = 25°C, unless otherwise noted.

Table 18.

Parameter	Rating
Storage Temperature (T_{ST}) Range	−65°C to +150°C
Ambient Operating Temperature (T_A) Range	−40°C to +125°C
Supply Voltages (V_{DD1}, V_{DD2})	−0.5 V to +7.0 V
Input Voltages (V_{IA}, V_{IB}, V_{IC}, MCLK, MO, SO, $\overline{MSS}$)	−0.5 V to V_{DDx} + 0.5 V
Output Voltages (SCLK, $\overline{SSS}$, MI, SI, V_{OA}, V_{OB}, V_{OC})	−0.5 V to V_{DDx} + 0.5 V
Average Current per Output Pin[1]	−10 mA to +10 mA
Common-Mode Transients[2]	−100 kV/µs to +100 kV/µs

[1] See Figure 4 for maximum safety rated current values across temperature.
[2] Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings may cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 19. Maximum Continuous Working Voltage[1]

Parameter	Value	Constraint
60 Hz AC Voltage	400 V rms	20-year lifetime at 0.1% failure rate, zero average voltage
DC Voltage	1173 V peak	Limited by the creepage of the package, Pollution Degree 2, Material Group II[2, 3]

[1] See the Insulation Lifetime section for more details.
[2] Other pollution degree and material group requirements yield a different limit.
[3] Some system level standards allow components to use the printed wiring board (PWB) creepage values. The supported dc voltage may be higher for those standards.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

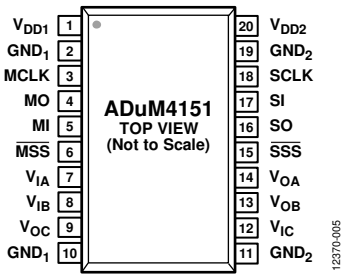

Figure 5. ADuM4151 Pin Configuration

Table 20. ADuM4151 Pin Function Descriptions

Pin No.	Mnemonic	Direction	Description
1	V_{DD1}	Power	Input Power Supply for Isolator Side 1. A bypass capacitor from V_{DD1} to GND_1 to local ground is required.
2, 10	GND_1	Return	Ground 1. Ground reference for Isolator Side 1.
3	MCLK	Input	SPI Clock from the Master Controller.
4	MO	Input	SPI Data from the Master to the Slave MO/SI Line.
5	MI	Output	SPI Data from the Slave to the Master MI/SO Line.
6	$\overline{MSS}$	Input	Slave Select from the Master. This signal uses an active low logic. The slave select pin requires a 10 ns setup time from the next clock or data edge.
7	V_{IA}	Input	Low Speed Data Input A.
8	V_{IB}	Input	Low Speed Data Input B.
9	V_{OC}	Output	Low Speed Data Output C.
11, 19	GND2	Return	Ground 2. Ground reference for Isolator Side 2.
12	V_{IC}	Input	Low Speed Data Input C.
13	V_{OB}	Output	Low Speed Data Output B.
14	V_{OA}	Output	Low Speed Data Output A.
15	$\overline{SSS}$	Output	Slave Select to the Slave. This signal uses an active low logic.
16	SO	Input	SPI Data from the Slave to the Master MI/SO Line.
17	SI	Output	SPI Data from the Master to the Slave MO/SI Line.
18	SCLK	Output	SPI Clock from the Master Controller.
20	V_{DD2}	Power	Input Power Supply for Isolator Side 2. A bypass capacitor from V_{DD2} to GND_2 to local ground is required.

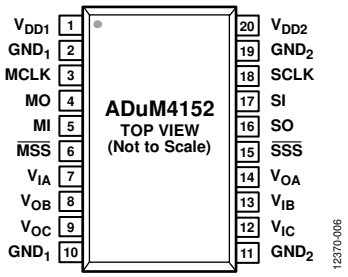

Figure 6. ADuM4152 Pin Configuration

APPLICATIONS INFORMATION

INTRODUCTION

The ADuM4151/ADuM4152/ADuM4153 are a family of devices created to optimize isolation of SPI for speed and to provide additional low speed channels for control and status monitoring functions. The isolators are based on differential signaling *i*Coupler technology for enhanced speed and noise immunity.

High Speed Channels

The ADuM4151/ADuM4152/ADuM4153 have four high speed channels. The first three channels, CLK, MI/SO, and MO/SI (the slash indicates the connection of the particular input and output channel across the isolator), are optimized for either low propagation delay in the B grade or high noise immunity in the A grade. The difference between the grades is the addition of a glitch filter to these three channels in the A grade version, which increases the propagation delay. The B grade version, with a maximum propagation delay of 14 ns, supports a maximum clock rate of 17 MHz in the standard 4-wire SPI. However, because the glitch filter is not present in the B grade version, ensure that spurious glitches of less than 10 ns are not present.

Glitches of less than 10 ns in the B grade devices can cause the missing of the second edge of the glitch. This pulse condition is then seen as a spurious data transition on the output that is corrected by a refresh or the next valid data edge. It is recommended to use the A grade devices in noisy environments.

The relationship between the SPI signal paths and the pin mnemonics of the ADuM4151/ADuM4152/ADuM4153 and the data directions is detailed in Table 24.

Table 24. Pin Mnemonics Correspondence to the SPI Signal Path Names

SPI Signal Path	Master Side 1	Data Direction	Slave Side 2
CLK	MCLK	→	SCLK
MO/SI	MO	→	SI
MI/SO	MI	←	SO
$\overline{SS}$	$\overline{MSS}$	→	$\overline{SSS}$

The datapaths are SPI mode agnostic. The CLK and MO/SI SPI datapaths are optimized for propagation delay and channel to channel matching. The MI/SO SPI datapath is optimized for propagation delay. The devices do not synchronize to the clock channels; therefore, there are no constraints on the clock polarity or the timing with respect to the data lines. To allow compatibility with nonstandard SPI interfaces, the MI pin is always active, and does not tristate when the slave select is not asserted. This precludes tying several MI lines together without adding a trisate buffer or multiplexor.

$\overline{SS}$ (slave select bar) is typically an active low signal. $\overline{SS}$ can have many different functions in SPI and SPI like busses. Many of these functions are edge triggered; therefore, the $\overline{SS}$ path contains a glitch filter in both the A grade and the B grade. The glitch filter prevents short pulses from propagating to the output or causing other errors in operation. The $\overline{MSS}$ signal requires a 10 ns setup time in the B grade devices prior to the first active clock edge to allow the added propagation time of the glitch filter.

Low Speed Data Channels

The low speed data channels are provided as economical isolated datapaths where timing is not critical. The dc value of all high and low speed inputs on a given side of the devices are sampled simultaneously, packetized and shifted across an isolation coil. The high speed channels are compared for dc accuracy, and the low speed data is transferred to the appropriate low speed outputs. The process is then reversed by reading the inputs on the opposite side of the devices, packetizing them and sending them back for similar processing. The dc correctness data for the high speed channels is handled internally, and the low speed data is clocked to the outputs simultaneously.

A free running internal clock regulates this bidirectional data shuttling. Because data is sampled at discrete times based on this clock, the propagation delay for a low speed channel is between 0.1 µs and 2.6 µs, depending on where the input data edge changes with respect to the internal sample clock.

Figure 14 illustrates the behavior of the low speed channels and the relationship between the codirectional channels.

- Point A: When data is sampled between the input edges of two low speed data inputs, a very narrow gap between edges is increased to the width of the output clock.
- Point B: Data edges that occur on codirectional channels between samples are sampled and simultaneously sent to the outputs, which synchronizes the data edges between the two channels at the outputs.
- Point C: Data pulses that are less than the minimum low speed pulse width may not be transmitted because they may not be sampled.

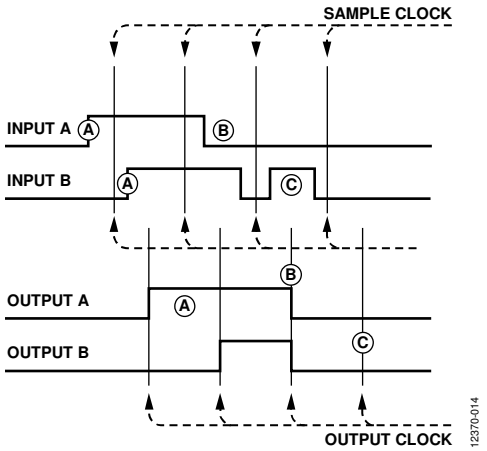

Figure 14. Slow Channel Timing

The low speed data system is carefully designed so that staggered data transitions at the inputs become either synchronized or pushed apart when they are presented at the output. Edge order is always preserved for as long as the edges are separated by at least $t_{VIx\ SKEW}$. In other words, if one edge is leading another at the input, the order of the edges is not reversed by the isolator.

PRINTED CIRCUIT BOARD (PCB) LAYOUT

The ADuM4151/ADuM4152/ADuM4153 digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at both the V_{DD1} and V_{DD2} supply pins (see Figure 15). The capacitor value must be between 0.01 µF and 0.1 µF. The total lead length between both ends of the capacitor and the input power supply pin must not exceed 20 mm.

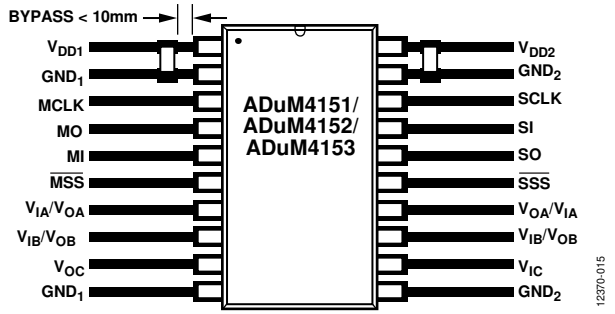

Figure 15. Recommended PCB Layout

In applications involving high common-mode transients, it is important to minimize board coupling across the isolation barrier. Furthermore, design the PCB layout so that any coupling that does occur affects all pins equally on a given component side. Failure to ensure this may cause voltage differentials between pins that exceed the absolute maximum ratings of the device, thereby leading to latch-up or permanent damage.

PROPAGATION DELAY RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The input to output propagation delay time for a high to low transition may differ from the propagation delay time of a low to high transition.

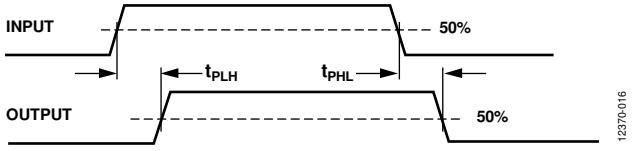

Figure 16. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and an indication of how accurately the timing of the input signal is preserved.

Channel to channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM4151/ADuM4152/ADuM4153 component.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (~1 ns) pulses to be sent via the transformer to the decoder. The decoder is bistable and is, therefore, either set or reset by the pulses indicating input logic transitions. In the absence of logic transitions at the input for more than ~1.2 µs, a periodic set of refresh pulses indicative of the correct input state are sent via the low speed channel to ensure dc correctness at the output.

If the low speed decoder receives no pulses for more than about 5 µs, the input side is assumed to be unpowered or nonfunctional, in which case, the isolator output is forced to a high-Z state by the watchdog timer circuit.

The limitation on the magnetic field immunity of the device is set by the condition in which induced voltage in the transformer receiving coil is sufficiently large to either falsely set or reset the decoder. The following analysis defines such conditions. The ADuM4151/ADuM4152/ADuM4153 were examined in a 3 V operating condition because it represents the most susceptible mode of operation for this product.

The pulses at the transformer output have an amplitude greater than 1.5 V. The decoder has a sensing threshold of about 1.0 V; thereby, establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\Sigma\pi r_n^2;\ n = 1, 2, \ldots, N$$

where:
β is the magnetic flux density.
r_n is the radius of the nth turn in the receiving coil.
N is the number of turns in the receiving coil.

Given the geometry of the receiving coil in the ADuM4151/ADuM4152/ADuM4153 and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 17.

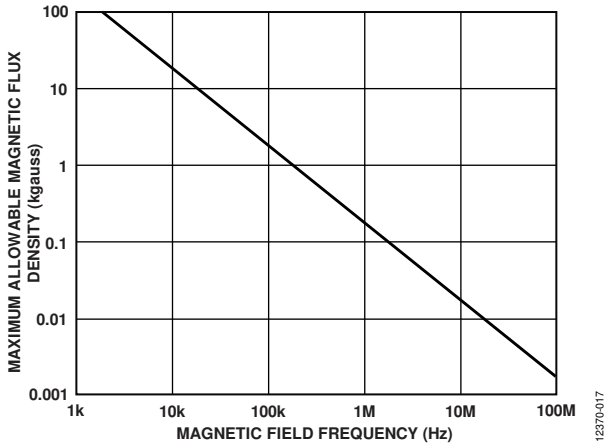

Figure 17. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.5 kgauss, induces a voltage of 0.25 V at the receiving coil. This voltage is about 50% of the sensing threshold and does not cause a faulty output transition. If such an event occurs, with the worst-case polarity, during a transmitted pulse, the interference reduces the received pulse from >1.0 V to 0.75 V. This voltage is still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances away from the ADuM4151/ADuM4152/ADuM4153 transformers. Figure 18 expresses these allowable current magnitudes as a function of frequency for selected distances. The ADuM4151/ADuM4152/ADuM4153 are insensitive to external fields. Only extremely large, high frequency currents, very close to the component are a concern. For the 1 MHz example noted, placing a 1.2 kA current 5 mm away from the ADuM4151/ADuM4152/ADuM4153 affects component operation.

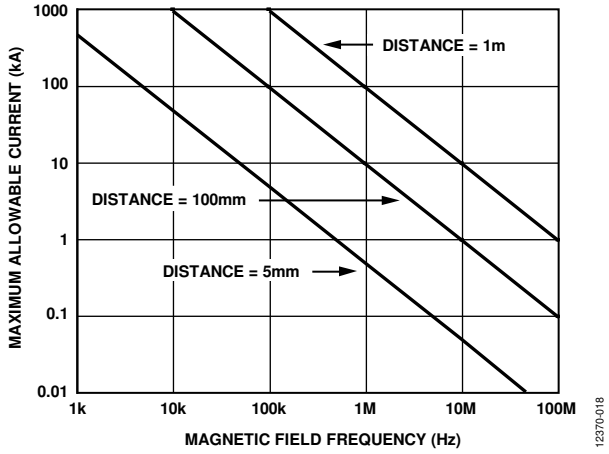

Figure 18. Maximum Allowable Current for Various Current to ADuM4151/ADuM4152/ADuM4153 Spacings

At combinations of strong magnetic field and high frequency, any loops formed by the PCB traces may induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Take care to avoid PCB structures that form loops.

POWER CONSUMPTION

The supply current at a given channel of the ADuM4151/ADuM4152/ADuM4153 isolators is a function of the supply voltage, the data rate of the channel, and the output load of the channel and whether it is a high or low speed channel.

The low speed channels draw a constant quiescent current caused by the internal ping-pong datapath. The operating frequency is low enough that the capacitive losses caused by the recommended capacitive load are negligible compared to the quiescent current. The explicit calculation for the data rate is eliminated for simplicity, and the quiescent current for each side of the isolator due to the low speed channels can be found in Table 3, Table 6, Table 9, and Table 12 for the particular operating voltages.

These quiescent currents add to the high speed current as is shown in the following equations for the total current for each side of the isolator. Dynamic currents are taken from Table 3 and Table 6 for the respective voltages.

For Side 1, the supply current is given by

$$I_{DD1} = I_{DDI(D)} \times (f_{MCLK} + f_{MO} + f_{\overline{MSS}}) + f_{MI} \times (I_{DDO(D)} + ((0.5 \times 10^{-3}) \times C_{L(MI)} \times V_{DD1})) + I_{DD1(Q)}$$

For Side 2, the supply current is given by

$$I_{DD2} = I_{DDI(D)} \times f_{SO} + f_{SCLK} \times (I_{DDO(D)} + ((0.5 \times 10^{-3}) \times C_{L(SCLK)} \times V_{DD2})) + f_{SI} \times (I_{DDO(D)} + ((0.5 \times 10^{-3}) \times C_{L(SI)} \times V_{DD2})) + f_{\overline{SSS}} \times (I_{DDO(D)} + ((0.5 \times 10^{-3}) \times C_{L(\overline{SSS})} \times V_{DD2})) + I_{DD2(Q)}$$

where:

$I_{DDI(D)}$, $I_{DDO(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).
f_x is the logic signal data rate for the specified channel (Mbps).
$C_{L(x)}$ is the load capacitance of the specified output (pF).
V_{DDx} is the supply voltage of the side being evaluated (V).
$I_{DD1(Q)}$, $I_{DD2(Q)}$ are the specified Side 1 and Side 2 quiescent supply currents (mA).

Figure 8 and Figure 11 show the typical supply current per channel as a function of data rate for an input and unloaded output. Figure 9 and Figure 12 show the total I_{DD1} and I_{DD2} supply currents as a function of data rate for the ADuM4151/ADuM4152/ADuM4153 channel configurations with all high speed channels running at the same speed and the low speed channels at idle.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation as well as the materials and material interfaces.

Two types of insulation degradation are of primary interest: breakdown along surfaces exposed to the air and insulation wear out. Surface breakdown is the phenomenon of surface tracking and the primary determinant of surface creepage requirements in system level standards. Insulation wear out is the phenomenon where charge injection or displacement currents inside the insulation material cause long-term insulation degradation.

Surface Tracking

Surface tracking is addressed in electrical safety standards by setting a minimum surface creepage based on the working voltage, the environmental conditions, and the properties of the insulation material. Safety agencies perform characterization testing on the surface insulation of components that allow the components to be categorized into different material groups. Lower material group ratings are more resistant to surface tracking and, therefore, can provide adequate lifetime with smaller creepage. The minimum creepage for a given working voltage and material group is in each system level standard and is based on the total rms voltage across the isolation, pollution degree, and material group. The material group and creepage for the ADuM4151/ADuM4152/ADuM4153 isolators are detailed in Table 15.

Insulation Wear Out

The lifetime of insulation due to wear out is determined by its thickness, the material properties, and the voltage stress applied. It is important to verify that the product lifetime is adequate at the application working voltage. The working voltage supported by an isolator for wear out may not be the same as the working voltage supported for tracking. It is the working voltage applicable to tracking that is specified in most standards.

Testing and modeling have shown that the primary driver of long-term degradation is displacement current in the polyimide insulation causing incremental damage. The stress on the insulation can be broken down into broad categories, such as dc stress, which causes very little wear out because there is no displacement current, and an ac component time varying voltage stress, which causes wear out.

The ratings in certification documents are usually based on 60 Hz sinusoidal stress because this stress reflects isolation from line voltage. However, many practical applications have combinations of 60 Hz ac and dc across the barrier, as shown in Equation 1. Because only the ac portion of the stress causes wear out, the equation can be rearranged to solve for the ac rms voltage, as shown in Equation 2. For insulation wear out with the polyimide materials used in this product, the ac rms voltage determines the product lifetime.

$$V_{RMS} = \sqrt{V_{AC\ RMS}{}^2 + V_{DC}{}^2} \quad (1)$$

or

$$V_{AC\ RMS} = \sqrt{V_{RMS}{}^2 - V_{DC}{}^2} \quad (2)$$

where:
$V_{AC\ RMS}$ is the time varying portion of the working voltage.
V_{RMS} is the total rms working voltage.
V_{DC} is the dc offset of the working voltage.

Calculation and Use of Parameters Example

The following is an example that frequently arises in power conversion applications. Assume that the line voltage on one side of the isolation is 240 V ac rms, and a 400 V dc bus voltage is present on the other side of the isolation barrier. The isolator material is polyimide. To establish the critical voltages in determining the creepage clearance and lifetime of a device, see Figure 19 and the following equations.

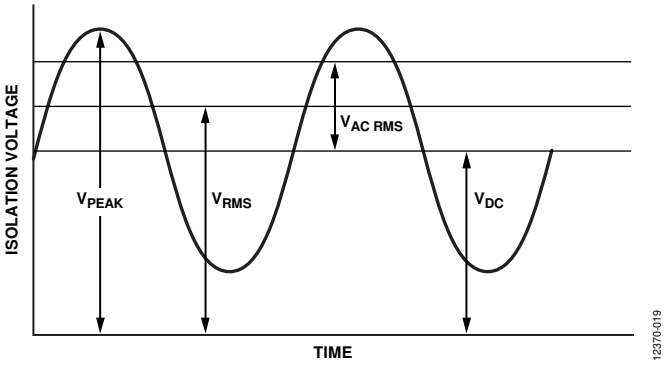

Figure 19. Critical Voltage Example

The working voltage across the barrier from Equation 1 is

$$V_{RMS} = \sqrt{V_{AC\ RMS}{}^2 + V_{DC}{}^2}$$

$$V_{RMS} = \sqrt{240^2 + 400^2}$$

$$V_{RMS} = 466\ \text{V}$$

The 466 V rms is the working voltage used together with the material group and pollution degree when looking up the creepage required by a system standard.

To determine if the lifetime is adequate, obtain the time varying portion of the working voltage. The ac rms voltage can be obtained from Equation 2.

$$V_{AC\ RMS} = \sqrt{V_{RMS}{}^2 - V_{DC}{}^2}$$

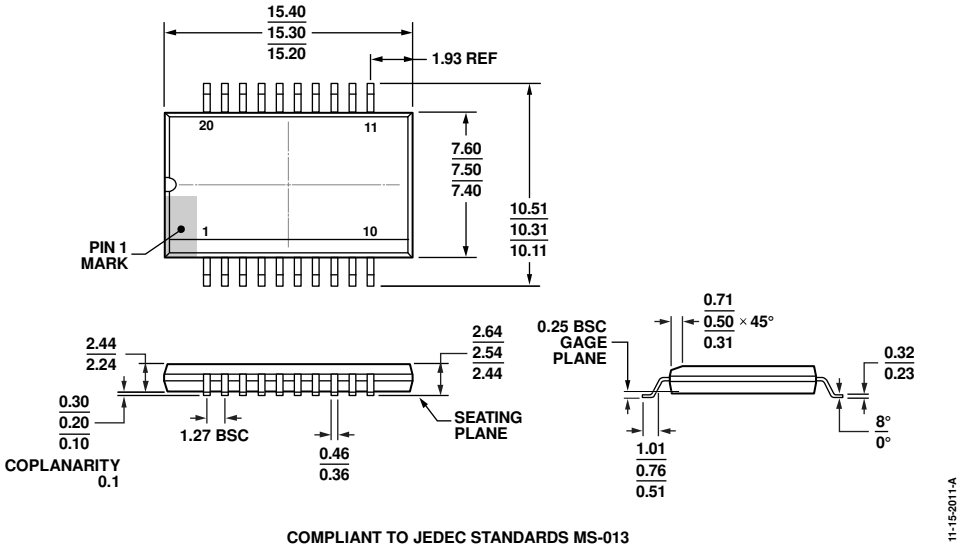
$$V_{AC\ RMS} = \sqrt{466^2 - 400^2}$$

$$V_{AC\ RMS} = 240\ \text{V}$$

In this case, the ac rms voltage is simply the line voltage of 240 V rms. This calculation is more relevant when the waveform is not sinusoidal. The value is compared to the limits for the working voltage listed in Table 19 for the expected lifetime, less than a 60 Hz sine wave, and it is well within the limit for a 50-year service life.

Note that the dc working voltage limit in Table 19 is set by the creepage of the package as specified in IEC 60664-1. This value may differ for specific system level standards

OUTLINE DIMENSIONS



COMPLIANT TO JEDEC STANDARDS MS-013

EVAL-ADuM3151Z							Evaluation Board	

[1] Z = RoHS Compliant Part.
[2] The EVAL-ADuM3151Z uses a functionally equivalent device for evaluation. The pad layout on the EVAL-ADuM3151Z board does not support the 20-lead SOIC_IC package.
[3] To evaluate the functionality of the alternative low speed channel configurations of the ADuM4152 and the ADuM4153, the user must purchase an ADuM3152 or an ADuM3153 and replace the component on the EVAL-ADuM3151Z evaluation board.
