FAN OUTPUT-J500

J500 provides a 12V@0.4mA output to support a system cooling fan. The fan output is always available when AC input is present, so it also can be used for a 12V standby output is so desired.

AC POWER FAILURE/DC OK AND INHIBIT SIGNALS – J600

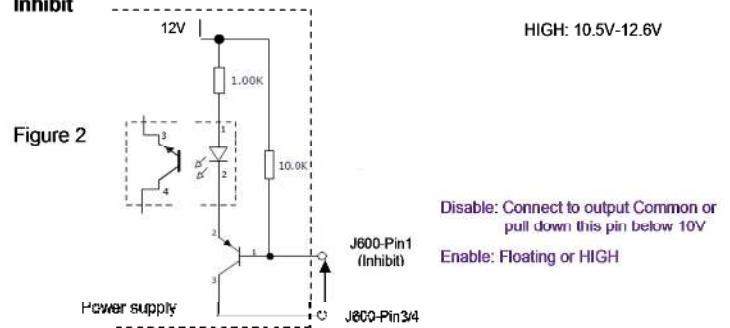

AC Power Failure/DC OK

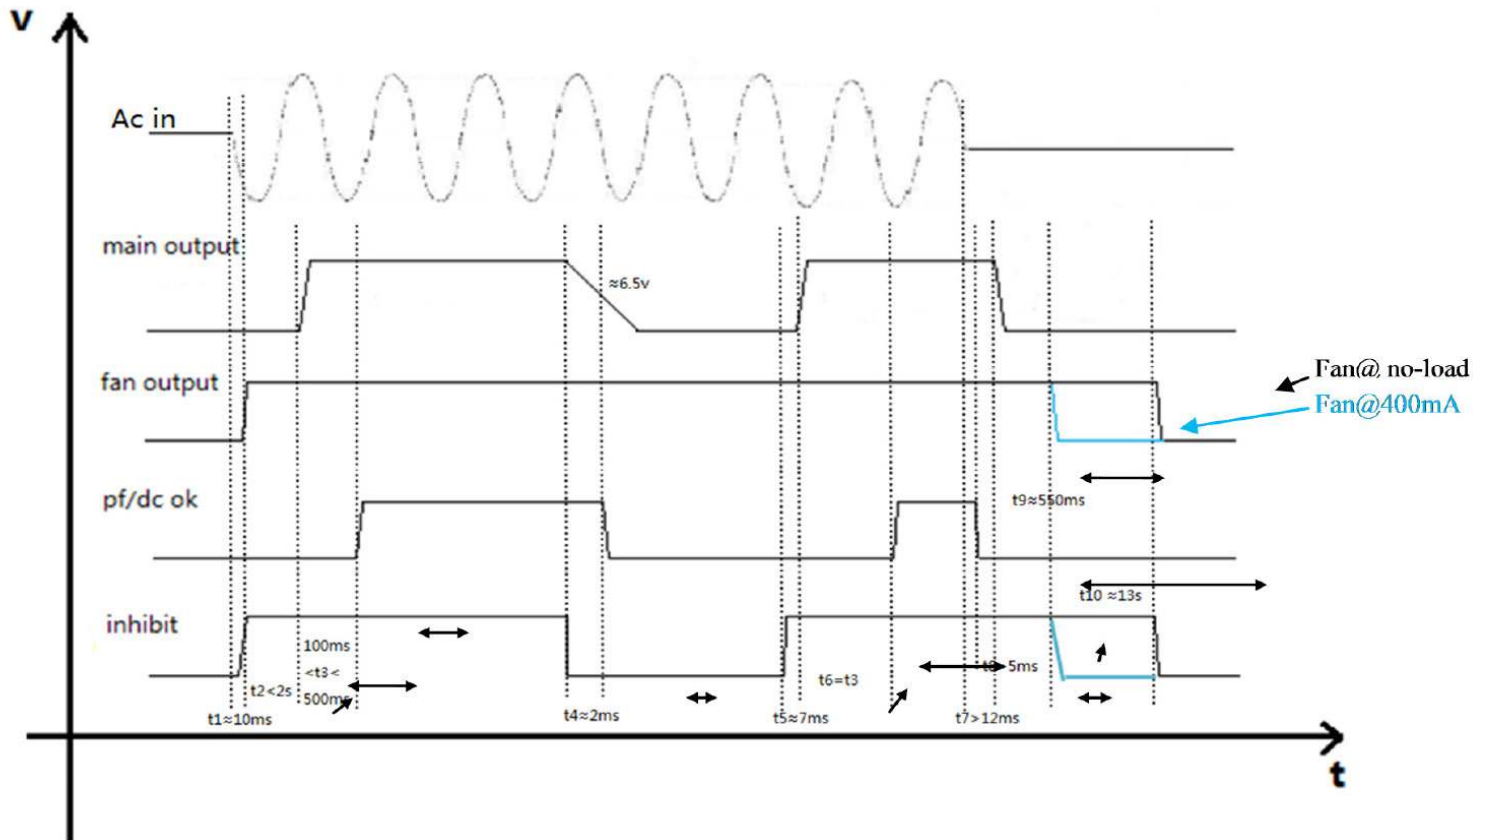

AC Power failure and DC OK signals use the same pin, so the signals can be used as follows:

DC OK: Pin2 = HIGH & Pin1 = HIGH AC Power Failure: Pin2 = LOW & Pin1 = LOW

CHARACTERISTIC CURVES

Output vs. Temperature

120W convection cooled and 175W continuous with 200 LFM airflow, Derating output power to 50% at 70°C.

Efficiency vs. Loading

The high efficiency is achieved by using LLC technology, PFC topology minimizing switching losses. Synchronous SCHOTTKY or ultra-fast diode is used as rectifier in CINT1175 family because of high output voltage level.

Noise & Ripple

To verify that the output ripple and noise does not exceed the level specified in the product specification. Measured using a scope probe socket with 0.1 μ F ceramic and a 10 μ F electrolysis capacitor connected in parallel across it, BW limit with 20MHz.

Output Transient Response

50% load step within the regulation limits of minimum and maximum load, $di/dt < 0.2A/\mu$ Sec. Recovery time not specified as there is no laps in regulation with a 50% Load Step. Maximum voltage deviation is 3%. This test is performed on the main output only.

Output Overload Characteristic

Supply shall protect itself against Overload conditions. The Power Supply shall recover from Overload Conditions without operator intervention.

Output Overshoot

When supply is turned on, off or when the load is stepped 100%, the Power Supply Overshoot/Undershoot shall not exceed minimum or maximum of output voltage regulation.
