

BQ21080 I²C Controlled, 1-Cell, 0.8-A Linear Battery Charger with Power Path and Ship Mode

1 Features

- 800-mA Power path linear battery charger
 - 3.0-V to 5.9-V input voltage operating range optimized for battery to battery charging and USB adapter
 - 25-V tolerant input voltage
 - Configurable battery regulation voltage with 0.5% accuracy from 3.6 V to 4.65 V in 10-mV steps
 - 5-mA to 800-mA configurable fast charge current
 - 55-mΩ battery FET ON resistance
 - Up to 2.5-A discharge current to support high system loads
 - Configurable termination current down to 0.5 mA
 - Configurable NTC charging profile thresholds including JEITA support
 - Power cycle and advanced reset mechanisms to recover system
- Power path management for powering the system and charging the battery
 - Regulated system voltage (SYS) ranging from 4.4 V to 4.9 V in addition to battery voltage tracking and input pass-through options
 - Configurable input current limit
 - Selectable adapter or battery power for system
 - Dynamic power path management optimizes charging from weak adapters
- Ultra low quiescent current modes
 - 30-nA Shutdown mode
 - 3.2-μA Ship mode with button press wake
 - 4 μA in Battery Only mode
 - 45-μA input adapter I_q in Sleep mode
- One push-button wake-up and reset input
- Integrated fault protection
 - Input overvoltage protection (V_{IN_OVP})
 - Battery undervoltage protection (V_{BUVLO})
 - Battery short protection (BATSC)
 - Battery overcurrent protection (BATOCP)
 - Input current limit protection (ILIM)
 - Thermal regulation (TREG) and thermal shutdown (TSHUT)
 - Battery thermal fault protection (TS)
 - Watchdog and safety timer fault
 - System short protection
 - System overvoltage protection

2 Applications

- [TWS headset and charging case](#)
- [Smart glasses, AR and VR](#)
- [Smart watches and other wearable devices](#)
- [Retail automation and payment](#)
- [Building automation](#)

3 Description

The BQ21080 is a linear battery charger IC focusing on small solution size and low quiescent current for extending battery life. The device is available in an 8-ball chipscale package which does not need HDI PCB process for fabrication thereby reducing the PCB cost. The device can support up to 800-mA charging and system loads of up to 2.5 A.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
BQ21080	DSBGA (8)	1.6 mm x 1.1 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
January 2023	*	Initial Release

5 Description (continued)

The battery is charged using a standard Li-ion or LiFePO₄ charge profile with three phases: precharge, constant current and constant voltage. Thermal regulation provides the maximum charge current while managing the device temperature. The charger is also optimized for battery to battery charging with 3-V minimum input voltage operation and can withstand 25-V absolute maximum line transients. The device integrates a single push-button input and reset circuitry to reduce the total solution footprint.

6 Pin Configuration and Functions

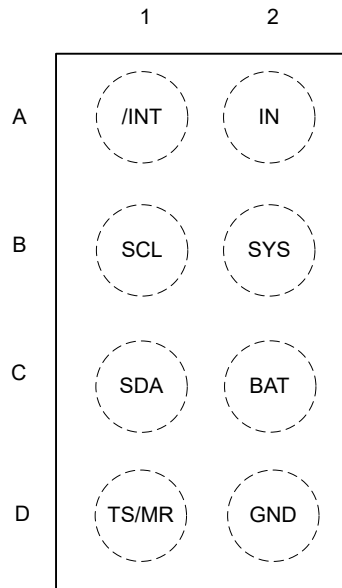

Figure 6-1. YBG Package 8-Pin DSBGA (Top View)

Table 6-1. Pin Functions

PIN		I/O ⁽¹⁾	DESCRIPTION
NAME	NO.		
IN	A2	P	DC Input Power Supply. IN is connected to the external DC supply. Bypass IN to GND with at least 1 μ F of capacitance using a ceramic capacitor.
SYS	B2	P	Regulated System Output. Connect at least 10- μ F ceramic capacitor (at least >1 μ F of ceramic capacitance with DC bias derating) from SYS to GND as close to the SYS and GND pins as possible.
BAT	C2	P	Battery Connection. Connect to the positive terminal of the battery. Bypass BAT to GND with at least 1 μ F of ceramic capacitance.
GND	D2	-	Ground connection. Connect to the ground plane of the circuit.
SCL	B1	I/O	I ² C Interface Clock. Connect SCL to the logic rail through a 10-k Ω pullup resistor.
SDA	C1	I/O	I ² C Interface Data. Connect SDA to the logic rail through a 10-k Ω pullup resistor.
/INT	A1	O	INT is an open-drain output that signals fault interrupts. When a fault occurs, a 128- μ s active low pulse is sent out as an interrupt for the host. INT is enabled/disabled using the MASK_INT bit in the control register. Can be pulled up to the logic rail through a 1-k Ω to 20-k Ω resistor.
TS/MR	D1	I/O	Manual Reset Input/ NTC thermistor pin. TS/MR is a general purpose input that must be held low for greater than t_{L_PRESS} to go into Ship mode or perform a hardware reset. It can also be used to detect shorter button press durations such as t_{WAKE1} and t_{WAKE2} . TSMR may be driven by a momentary push-button or a MOS switch. The TSMR pin can also have an NTC thermistor connected on to it.

(1) I = Input, O = Output, I/O = Input or Output, G = Ground, P = Power.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input Voltage	IN	-0.3	25	V
Voltage	All other pins	-0.3	5.5	V
Input Current (DC)	IN		1.1	A
SYS Discharge Current(DC)	SYS		1.5	A
SYS Discharge Current (tpulse <20ms)	SYS		2.5	A
Output Sink Current	/INT		20	mA
T _J	Junction temperature	-40	150	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±2500	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Thermal Information

THERMAL METRIC		BQ21080	UNIT
		YBG (DSBGA)	
		8 PIN	
R _{θJA}	Junction-to-ambient thermal resistance (EVM ⁽²⁾)	65	°C/W
R _{θJA}	Junction-to-ambient thermal resistance (JEDEC ⁽¹⁾)	107.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.9	°C/W
R _{θJB}	Junction-to-board thermal resistance	30.3	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	30.3	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
(2) 1oz Copper, 2-layer board

7.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VBAT	Battery Voltage Range	2.2		4.6	V
VIN	Input Voltage Range	2.7		5.5	V

7.4 Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IIN	Input Current Range (IN to SYS)			1.1	A
IBAT	Battery Discharge Current (BAT to SYS)			1.5	A
TJ	Operating Junction Temperature Range	-40		125	°C

7.5 Electrical Characteristics

VIN = 5V, VBAT = 3.6V. TJ =25°C unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

8 Detailed Description

8.1 Overview

The BQ21080 integrates a linear charger that allows the battery to be charged with a programmable charge current of up to 800 mA. In addition to the charge current, other charging parameters can be programmed through I²C such as the precharge, termination, battery regulation voltage, and input current limit.

The power path allows the system to be powered from a regulated output, SYS, even when the battery is deeply discharged or charging, by drawing power from IN pin. It also prioritizes the system load in SYS, reducing the charging current, if necessary, in order support the load when input power is limited. If the input supply is removed and the battery voltage level is above V_{BUVLO} , SYS will automatically and seamlessly switch to battery power.

Charging is done through the internal battery MOSFET. There are several loops that influence the charge current: constant current loop (CC), constant voltage loop (CV), input current limit, thermal regulation, V_{DPPM} , and V_{INDPM} . During the charging process, all loops are enabled and the one that is dominant takes control.

The device supports multiple battery chemistries for single-cell applications, through adjustable battery regulation voltage regulation (V_{BATREG}) and charge current (I_{CHG}) options.

8.1.1 Battery Charging Process

When a valid input source is connected ($V_{IN} > V_{UVLO}$ and $V_{BAT} + V_{SLEEPZ} \leq V_{IN} < V_{IN_OVP}$), the state of the CHARGE_DISABLE bit and the TSMR pin determines whether a charge cycle is initiated. When the CHARGE_DISABLE bit is set to disable charging, $V_{HOT} < V_{TS} < V_{COLD}$ and a valid input source is connected, the battery discharge FET is turned off, preventing any charging of the battery. Note that supplement behavior is independent of the CHARGE_DISABLE bit.

The following figure illustrates a typical charge cycle.

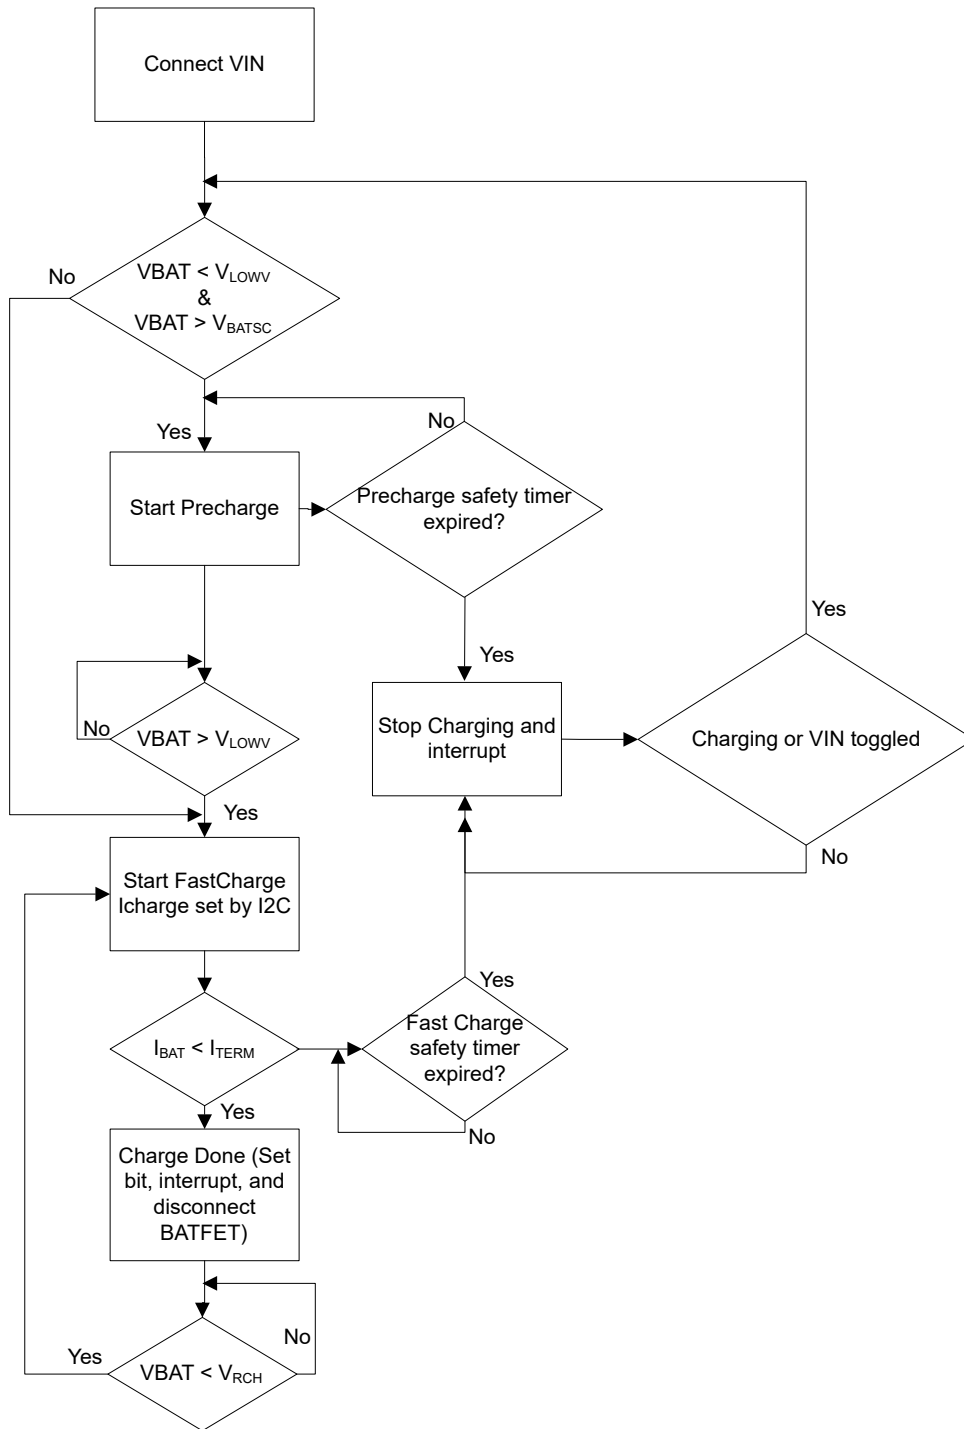

Figure 8-1. Charger Flow Diagram

8.1.1.1 Trickle Charge

In order to prevent damage to the battery, the device will charge the battery at a much lower current level (IBATSC) when the battery voltage (VBAT) is below the VBATSC threshold. During trickle charge, the device still counts against the precharge safety timer. Rather trickle charge and precharge are counting against the same duration of 25% of the fast charge timer.

8.1.1.2 Precharge

When battery voltage is above the V_{BATSC} but lower than V_{LOWV} threshold, the battery is charged with the precharge current level. The precharge current (IPRECHARGE) can be programmed through I²C and can be adjusted by the host. Once the battery voltage reaches V_{LOWV} , the charger will then operate in Fast Charge mode, charging the battery at ICHG.

During precharge, the safety timer is set to 25% of the safety timer value during fast charge. In the case where termination is disabled, precharge current is set to 20% of fast charge current setting.

8.1.1.3 Fast Charge

The charger has two main control loops that control charging when $V_{BAT} > V_{LOWV}$: the Constant Current (CC) and Constant Voltage (CV) loops. When the CC loop is dominant, the battery is charged at the maximum charge current level I_{CHG} , unless there is a TS fault condition (JEITA operation), VINDPM is active, thermal regulation or DPPM is active. (See respective sections for details on these modes of operation). Once the battery voltage approaches the battery regulation target, the CV loops becomes more dominant and the charging current starts tapering off. Once the charging current reaches the termination current (I_{TERM}) the charge is done, Charge_done status is set. If the I²C setting of VBATREG is set higher than 4.65 V, the battery regulation voltage is still maintained at 4.65 V. The device will switch to fastcharge mode based on VLOWV setting on the register map.

8.1.1.4 Termination

The device will automatically terminate charging once the charge current reaches I_{TERM} , which is programmable through I²C. After termination the charger will operate in high impedance mode, disabling the BATFET to disconnect the battery. Power is provided to the system (SYS) by IN supply as long as $V_{IN} > V_{UVLO}$, $V_{IN} > V_{BAT} + V_{SLEEPZ}$ and $V_{IN} < V_{IN_OVP}$.

Termination is only enabled when the charger CV loop is active in fast charge operation. Termination is disabled if the charge current reaches I_{TERM} while the VINDPM, DPPM, or thermal regulation loops are active. The charger will only go into the termination when the current drops to I_{TERM} due to the battery reaching the target voltage and not due to the charge current limitation imposed by the previously mentioned controlled loops.

Post termination, the battery FET is disabled and the voltage on BAT pin is monitored to check if it has dropped to the VRCH threshold. If it does, a new charge cycle is established. The safety timers are reset. During charging or even when charge is done, a higher SYS load will be supported through the supplement operation.

Figure 8-2. Typical Charging Profile of a Battery

8.2 Functional Block Diagram

Figure 8-3. Functional Block Diagram

8.3 Feature Description

8.3.1 Input Voltage Based Dynamic Power Management (VINDPM)

The VINDPM loop prevents the input voltage from collapsing to a point where charging could be interrupted due to adapter voltage crashing below VINDPM value. This is done by reducing the current drawn by the charger enough to keep $V_{IN} > V_{INDPM}$ setting.

During the normal charging process, if the input power source is not able to support the programmed or default charging current and system load, the supply voltage decreases. Once the supply drops to VINDPM, the input DPM current and voltage loops will reduce the input current through the blocking FETs Q1 and Q2 to prevent the further drop of the supply. The VINDPM threshold is programmable through the I²C register and can be completely disabled. This is set through the VINDPM_0 and VINDPM_1 selection bits. When the device enters this mode, the charge current may be lower than the set value and the VINDPM_ACTIVE_STAT bit is set. If the 2x timer is set through the 2XTMR_EN bit, the safety timer is extended while VINDPM is active. Additionally, termination is disabled when VINDPM is active.

8.3.2 Dynamic Power Path Management Mode (DPPM)

With a valid input source connected, the power path management circuitry monitors the input voltage and current continuously. The current into IN is shared at SYS between charging the battery and powering the system load at SYS. If the sum of the charging and load currents exceeds the preset maximum input current, the input DPM loop reduces input current. If SYS drops below the DPPM voltage threshold, the charging current is reduced by the DPPM loop through the BATFET (Q3). If SYS falls below the supplement mode threshold after BATFET charging current is reduced to zero, the part will enter supplement mode. SYS voltage is maintained above battery voltage when the DPPM loop is in control. Battery termination is disabled when the DPPM loop is active.

The VDPPM threshold is typically 100 mV above VBAT. The VDPPM disable bit (VDPPM_DIS = b1) will allow the charger to operate with lower headroom on VSYS. In VBAT tracking mode where VSYS is VBAT+225 mV, disabling this bit will have no effect.

8.3.3 Battery Supplement Mode

While in DPPM mode, if the charging current falls to zero and the system load current increases beyond the programmed input current limit, the voltage at SYS reduces further. When the SYS voltage drops below the battery voltage to V_{BSUP1} , the battery supplements the system load. The battery stops supplementing the system load when the voltage on the SYS pin rises within the battery voltage to V_{BSUP2} . During supplement mode, the battery supplement current is not regulated, however, the BATOCP protection circuit is active if enabled. Battery termination is disabled while in supplement mode. Battery voltage has to be higher than the battery undervoltage lockout threshold (VBUVLO) in order to supplement the system.

8.3.4 SYS Power Control (SYS_MODE bit control)

The device also offers the option to control SYS through the I²C SYS_MODE bits. These bits can force SYS to be supplied by BAT instead of IN (even if $V_{IN} > V_{BAT} + V_{SLEEP}$), disconnect SYS from either supply, pull SYS down or leave it floating. The table below shows the device behavior based on SYS_MODE setting:

Table 8-1. Settings

SYS_MODE	DESCRIPTION	SYS SUPPLY	SYS PULLDOWN
00	Normal Operation	IN or BAT	Off except during HW reset
01	Force BAT power (IN disconnected)	BAT	Off except during HW reset
10	SYS Off – Floating	None	Off
11	SYS Off – Pulled Down	None	On

SYS_MODE = 00

This is the default state/normal operation of the device. SYS will be powered from IN if $V_{IN} > V_{UVLO}$, $V_{IN} > V_{BAT} + V_{SLEEPZ}$, and $V_{IN} < V_{IN_OVP}$. SYS will be powered by BAT if these conditions are not met. SYS will only be disconnected from IN or BAT and pulled down when a HW Reset occurs or the device goes into Ship mode.

SYS_MODE = 01

When this configuration is set, SYS will be powered by BAT if $V_{BAT} > V_{BUVLO}$ regardless of V_{IN} state. This allows the host to minimize the current draw from the adapter while it is still connected as needed in the system. If SYS_MODE = 01 is set while $V_{BAT} < V_{BUVLO}$, the SYS_MODE = 01 setting will be ignored and the device will go to SYS_MODE = 00. In the same manner, if the adapter (V_{IN}) is removed and then connected the device will also switch to SYS_MODE = 00. This prevents the device from needing a POR in order to restore power to the system thereby allowing battery charging. If SYS_MODE = 01 is set during charging, charging will be stopped and the battery will start to provide power to SYS as needed. The behavior is similar to that when the input adapter is disconnected.

SYS_MODE = 10

When this configuration is set, SYS will be disconnected and left floating. The device remains on and active. Toggling V_{IN} ($V_{IN} < V_{INUVLO}$) will reset SYS_MODE to 00.

SYS_MODE = 11

When this configuration is set, SYS will be disconnected and pulled down to ground. Toggling V_{IN} will reset SYS_MODE to 00.

8.3.4.1 SYS Pulldown Control

The device has an internal pulldown on the SYS pin which is enabled in the following cases:

Table 8-2. States

STATE	NOTES
Shipmode	Pulldown on SYS is enabled once the device enters shipmode and after disconnecting the BATFET
HW_RESET	Pulldown on SYS is enabled after the BATFET and input blocking FETs are disconnected and retained until the autowake timer expires
SYS_MODE = 11 (SYS pulldown mode)	Pulldown on SYS is enabled after the BATFET and input blocking FETs are disconnected and retained until either an I ² C transaction is issued to change SYS_MODE or VIN is toggled.

8.3.5 SYS Regulation

The device includes a SYS voltage regulation loop. By regulating the SYS voltage the device prevents downstream devices connected to SYS from being exposed to voltages as high as V_{IN_OVP} . SYS regulation is only active when $V_{IN} > V_{UVLO}$, $V_{IN} > V_{BAT} + V_{SLEEPZ}$ and $V_{IN} < V_{IN_OVP}$ rather than meeting the VIN_Powergood condition.

The SYS voltage regulation target can be controlled through the SYS_REG_CTRL_2:0 bits in the SYS_REG register to either track the battery, set to a fixed voltage, or enable pass through modes.

In battery tracking mode, the minimum voltage is at the V_{MINSYS} value for a battery < 3.6 V. As battery voltage increases VSYS is regulated to 225 mV above battery. If $V_{IN} < V_{MINSYS}$ and VIN_Powergood is still active, then SYS will be in dropout.

In fixed voltage mode, SYS voltage is regulated to a target set by the host ranging from 4.4 V to 4.9 V. If V_{IN} voltage is less than the SYS target voltage, then the device will be in dropout mode.

In pass through mode, the SYS path is unregulated and the V_{SYS} voltage is equal to V_{IN} .

Table 8-3. SYS Voltage Regulation Settings

SYS_REG_CTRL	VSYS TARGET
000	VBAT + 225 mV (3.8 V minimum)
001	4.4
010 (default)	4.5
011	4.6
100	4.7
101	4.8
110	4.9
111	Pass through

8.3.6 ILIM Control

The input current limit can be controlled through I²C by selecting the the ILIM bits.

If the ILIM clamp is active, the ILIM_ACTIVE_STAT bit is set.

MASK_ILIM will prevent an interrupt from being issued but does not override the ILIM behavior itself. The ILIM value can be programmed dynamically through the I²C by the host. The ILIM settings of 100mA and 500mA are designed to be the maximum value to support standard systems.

8.3.7 Protection Mechanisms

8.3.7.1 Input Overvoltage Protection

Input overvoltage protection protects the device and downstream components connected to SYS, and BAT against damage from overvoltage on the input supply. When $V_{IN} > V_{IN_OVP}$, a VIN overvoltage condition is determined to exist. During the VIN overvoltage condition, the device turns the input FET OFF, battery discharge FET ON, sends a single 128- μ s pulse on INT, and the fault bit (VIN_OVP_FAULT_FLAG) is updated over I²C. The VIN_PGOOD_STAT bit also is affected by the VIN overvoltage condition as the VIN powergood condition will fail. Once the VIN overvoltage condition is removed ($V_{IN} \leq V_{IN_OVP} - V_{IN_OV_HYS}$), the VIN_OVP_STAT bit is cleared and the device returns to normal operation. Thereafter, a VIN powergood condition is determined if $V_{IN} > V_{BAT} + V_{SLEEPZ}$ and $V_{IN} > V_{IN_UVLO}$.

8.3.7.2 Battery Undervoltage Lockout

In order to prevent deep discharge of the battery the device integrates a battery undervoltage lockout feature which will disengage the BAT to SYS path when voltage at the battery drops below the programmed BUVLO setting present in the CHARGERCTRL1 register. BUVLO status can also be read when a valid voltage on VIN is present.

8.3.7.3 System Overvoltage Protection

The system overvoltage protection is to prevent SYS from overshooting to a high voltage due to the input supply. SYS_OVP will momentarily disconnect the blocking FETs and re-engage when the thresholds have dropped to less than the SYS_OVP_FALLING threshold.

The SYS_OVP_RISING threshold is typically 105% of the target SYS voltage and the SYS_OVP_FALLING threshold is 102.5% of the target SYS voltage.

8.3.7.4 System Short Protection

When a valid adapter is connected to the device, the device turns ON the input blocking FET for 5 ms and it detects the SYS pin to be shorted (voltage on SYS < 1.6V). In this scenario, the device will turn OFF the input FET for ~200 μ s and turn it back ON for 5 ms for SYS to rise above 1.6V. If after 10 tries, the SYS short still persists, the device will turn OFF SYS until adapter is connected again.

8.3.7.5 Battery Overcurrent Protection

In order to protect the device from overcurrent and prevent excessive battery discharge current, the device detects if the current on the battery FET exceeds IBAT_OCP. If the BATOCP limit is reached, the battery discharge FET is turned off and the device starts operating in hiccup mode, re-enabling the BATFET t_{REC_SC} (250 ms) after being turned OFF by the overcurrent condition. If the overcurrent condition is triggered upon retry for 4 to 7 consecutive times in a 2-s window, the BATFET shall then remain off until a valid VIN is connected ($V_{IN} = V_{IN_POWERGOOD}$). If the overcurrent condition and hiccup operation occur while in supplement mode where VIN is already present, VIN must be toggled in order for the BATFET to be enabled and start another detection cycle.

8.3.7.6 Safety Timer and Watchdog Timer

At the beginning of each charge cycle mode (Precharge or Fast Charge), the device starts the respective mode safety timer. If charging has not terminated before the programmed safety time, t_{MAXCHG} expires or the device does not exit the precharge mode before t_{PRECHG} expires, charging is disabled. The precharge safety time, t_{PRECHG} , is 25% of t_{MAXCHG} . When a safety timer fault occurs, a single 128- μ s pulse is sent on the INT pin and the STAT and FAULT bits of the status registers are updated over I²C.

The charge enable bit or input power must be toggled in order to clear the safety timer fault.

If the safety timer has expired, the device will produce an interrupt and update the SAFETY_TMR_FAULT_FLAG bit on the register map. The safety timer duration is programmable using the SAFETY_TIMER_1:0 bits. When the safety timer is active, changing the safety timer duration resets the safety timer. The device also contains a 2XTMR_EN bit that doubles the safety timer duration to prevent premature safety timer expiration when the charge current is reduced by a high load on SYS (DPM operation- causing VDPPM to be enabled), VINDPM, thermal regulation, or a NTC (JEITA) condition. When the 2XTMR_EN bit is set, the timer is allowed to run at half speed when any loop is active other than CC or CV. In the event where during CC mode the battery voltage drops to push the charger into precharge mode, (due to a large load on battery, thermal events, and so forth) the safety timer will reset counting through precharge and then resetting the fast charge safety timer. If the device entered battery supplement mode while in precharge, CC or CV mode, while the charger is not disabled, the device will suspend the safety timer until charging can resume again. This prevents the safety timer from resetting when a supplement condition is caused.

In addition to the safety timer, the device contains a watchdog timer that monitors the host through the I²C interface. The watchdog timer is enabled by default and may be disabled by the host through an I²C transaction. Once the initial transaction is received, the watchdog timer is started. The watchdog timer is reset by any transaction by the host using the I²C interface. If the watchdog timer expires without a reset from the I²C interface, all charger parameters registers (ICHG, IPRECHARGE, ITERM, VLOWV, and so forth) are reset to the default values. The watchdog timer can be set through the WATCHDOG_SEL_1:0 bits either in battery only mode or when an adapter is present.

Table 8-4. Watchdog Settings

WATCHDOG_SEL_1:0	ACTION
00	Device will only perform a software reset after 160s of the last I ² C transaction
01	Device will issue a HW_Reset after 160s of last I ² C transaction
10	Device will issue a HW_Reset after 40s of the last I ² C transaction
11	Watchdog functionality is completely disabled

8.3.7.7 Thermal Protection and Thermal Regulation

During operation, to protect the device from damage due to overheating, the junction temperature of the die, T_J, is monitored. When T_J reaches T_{SHUT_RISING}, the device stops charging operation and VSYS is shutdown. If in the case where T_J > T_{SHUT_RISING} prior to power being applied to the device (either battery or adapter), the input FET or BATFET will not turn ON, regardless of the TSMR pin. Thereafter if temperature falls below T_{SHUT_FALLING}, the device will automatically power up if VIN is present or if in battery only mode.

During the charging process, to prevent overheating in the device, the device monitors the junction temperature of the die and reduces the charging current once T_J reaches the thermal regulation threshold (T_{REG}) based on bits set by the THERM_REG setting. If the charge current is reduced to 0, the battery supplies the current needed to supply the SYS output. Thermal regulation can be disabled through I²C.

Ensure that system power dissipation is under the limit of the device. The power dissipated by the device can be calculated using the following equation:

$$P_{DISS} = P_{SYS} + P_{BAT}$$

Where:

$$P_{SYS} = (V_{IN} - V_{SYS}) * I_{IN}$$

$$P_{BAT} = (V_{SYS} - V_{BAT}) * I_{BAT}$$

The die junction temperature, T_J, can be estimated based on the expected board performance using the following equation:

$$T_J = T_A + \theta_{JA} * P_{DISS}$$

θ_{JA} is largely driven by board layout. For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics Application Report](#). Under typical conditions, the time spent in this state is very short.

8.3.8 Pushbutton Wake and Reset Input

The pushbutton function implemented through the TSMR pin has three main functions. First, it serves as a means to wake the device from ultra-low power modes like ship mode. Second, it serves as a short button press detector, sending an interrupt to the host when the button driving the TSMR pin has been pressed for Wake1, Wake2, or long press durations. This allows the implementation of different functions in the end application such as menu selection and control. Finally it serves as a means to get the device into ship mode or reset the system by performing a power cycle/ hardware reset (shut down SYS and automatically powering it back on) after detecting a long button press. The timing for the short and long button press duration is programmable through I²C for added flexibility and allows system designers to customize the end user experience of a specific application. Note that if a specific timer duration is changed through I²C while that timer is active and has not expired, the new programmed value will be ignored until the timer expires and/or is reset by new push button action. In battery only mode the device will automatically pulse the TSMR current source ON for $t_{TS_DUTY_ON}$ duration and turn it OFF for $t_{TS_DUTY_OFF}$ duration to check if a button is pressed. If a button press is registered, the device will begin counting against Wake1, Wake2 or long press durations. This button press detection routine in battery only mode is run as long as it is enabled by the EN_PUSH bit. When a valid adapter is present, the TSMR current source is always ON to monitor charging.

8.3.8.1 Pushbutton Wake or Short Button Press Functions

There are two programmable wake or short button press timers, WAKE1 and WAKE2. There are no specific actions taken by the t_{WAKE1} or t_{WAKE2} durations other than issuing an interrupt and updating the wake registers. For a wake from shipmode event when the button press is enabled, the push button has to be low for $t_{shipwake}$ before the device can turn ON the SYS rail.

In the case where a valid V_{IN} ($V_{IN} > V_{UVLO}$) is connected prior to the $t_{shipwake}$ timer expiring, the device will exit shipmode immediately regardless of the TS/MR or wake timer state. Refer to [Section 8.5](#) for more details.

8.3.8.2 Pushbutton Reset or Long Button Press Functions

Depending on the configuration set on the pushbutton long press action register bits, the device will perform a shipmode entry or hardware reset or completely ignore the long button press action.

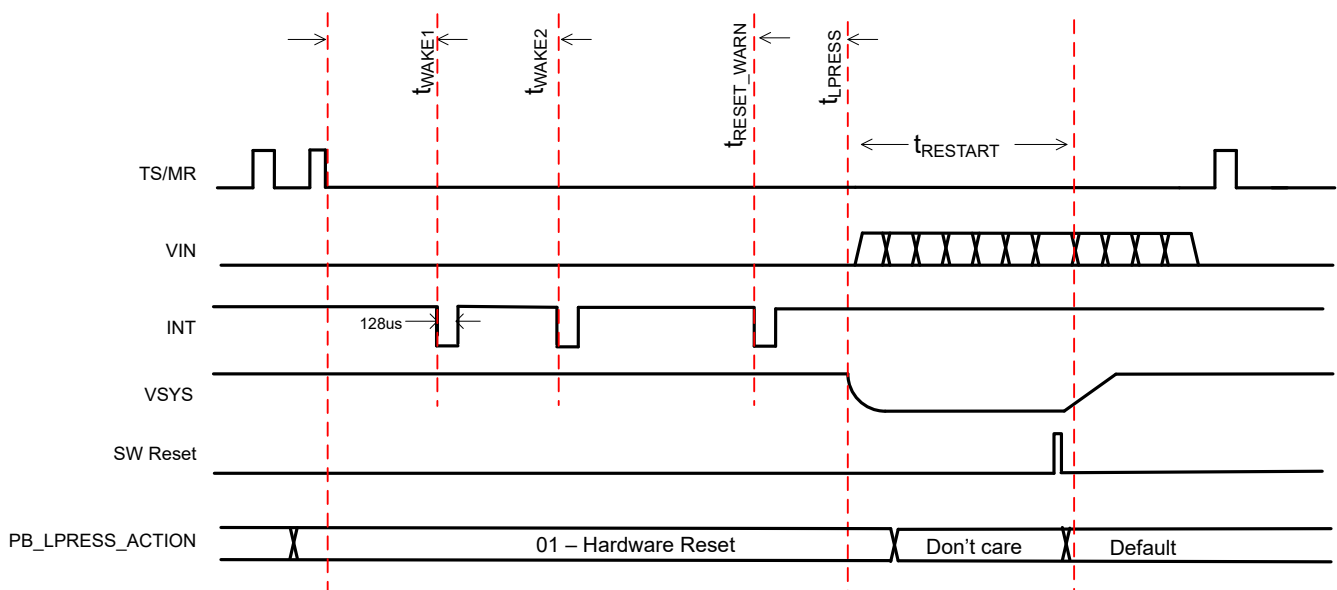

Figure 8-4. Pushbutton Long Press Reset

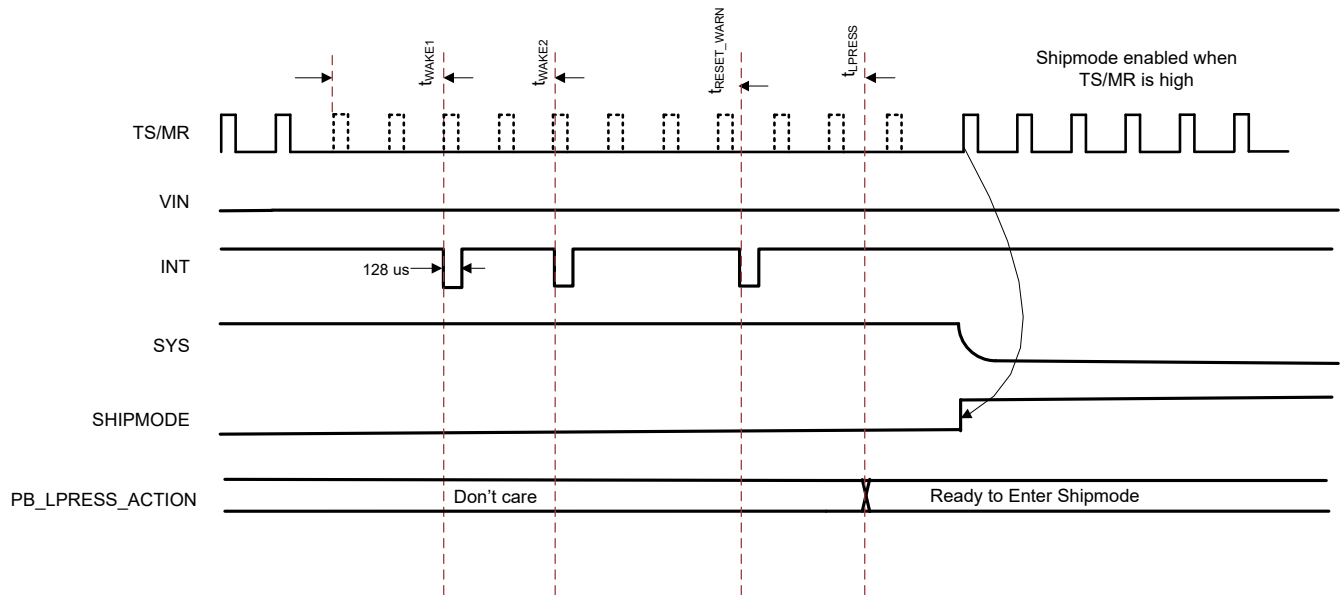

Figure 8-5. Pushbutton Long Press Shipmode

8.3.9 15-Second Timeout for HW Reset

Based on the I²C register bit WATCHDOG_15S_ENABLE the device can perform a HW reset/power cycle in the same manner a long button press or HW_RESET would. This 15-second watchdog or timeout is gated upon $V_{IN} > V_{VBAT} + V_{SLEEPZ}$ so that the HW reset would only occur if the host does not respond after a charger is connected and VIN_PGOOD_STAT is set.

If the charger is connected and the host responds before the 15-second watchdog expires, the part continues in normal operation and starts the normal 50-second watchdog timer if enabled. The 15-second watchdog may be enabled/disabled through I²C with the WATCHDOG_15S_ENABLE bit.

8.3.10 Hardware Reset

The BQ21080 is capable of a hardware reset to completely powercycle the system. This is particularly useful when a soft reset on the MCU or host fails to work. Below is a sequence of events during a hardware reset:

1. Turn OFF (if adapter is present) input blocking FET (Q1/Q2)
2. Turn OFF battery FET (Q3)
3. Engage pulldown on SYS
4. Start the Autowake timer
5. Once the Autowake timer expires, disconnect the pulldown on SYS
6. Reset all registers to default
7. Turn ON battery FET and input FET (if applicable)

8.3.11 Software Reset

When a software reset is issued either through a watchdog action configurable through the WATCHDOG_SEL bits or register reset configurable through the REG_RST bit, the device will reset all of the registers to the defaults. Any bits loaded through OTP memory are also loaded. If the device was waiting to go to shipmode (all conditions for entering ship are fulfilled except adapter removal), a hardware or software reset will cancel the pending shipmode request. If the shipmode request was written through I²C, the host can cancel the ship entry by clearing the bit before shipmode entry has happened.

8.3.12 Interrupt Indicator (/INT) Pin

The device contains an open-drain output that signals its status and is valid only after the device has completed start-up into a valid state. If the part starts into a fault, interrupts will not be sent.

The /INT pin is normally in high impedance and is pulled low for 128 μ s when an interrupt condition occurs. When a fault or status change occurs or any other condition that generates an interrupt, a 128- μ s pulse (/INT pin pulled down) is sent on /INT to notify the host.

Interrupts can be masked through I²C. If the interrupt condition occurs while the interrupt is masked an interrupt pulse will not be sent. If the interrupt is unmasked while the fault condition is still present, an interrupt pulse will not be sent until the /INT trigger condition occurs while unmasked. Below are a list of interrupts that can be masked through I²C.

Table 8-5. Mask Bit

MASK BIT	ACTION
ILIM_INT_MASK	Do not issue an /INT pulse when ILIM limiting occurs
VDPM_INT_MASK	Do not issue an /INT pulse when VINDPM or DDPM is active
TS_INT_MASK	Do not issue an /INT pulse when any of the TS events have occurred.
TREG_INT_MASK	Do not issue an /INT pulse when TREG is actively reducing the current
PG_INT_MASK	Do not issue an /INT pulse when VIN meets VIN_PG condition
BAT_INT_MASK	Do not issue an /INT pulse when BATOCP or BUVLO event is triggered
CHG_STATUS_INT_MASK	Do not send an interrupt anytime there is a charging status change.

8.3.13 External NTC Monitoring (TS)

8.3.13.1 TS Biasing and Function

The device can be configured to meet JEITA requirements or a simpler HOT/COLD function only. Additionally, the TS charger control function can be disabled through the TS_EN bit. This will only disable the TS charge action but the faults are still reported based on the TS voltage. To satisfy the JEITA requirements, four temperature thresholds are monitored: cold battery threshold, cool battery threshold, warm battery threshold, and hot battery threshold. These temperatures correspond to the VCOLD, VCOOL, VWARM, and VHOT thresholds in the Electrical Characteristics table. Charging and safety timers are suspended when $V_{TS} < V_{HOT}$ or $V_{TS} > V_{COLD}$. When $V_{COOL} < V_{TS} < V_{COLD}$, the charging current is reduced to the value programmed in the TS_Setting register/bit TS_ICHG_0. When $V_{HOT} < V_{TS} < V_{WARM}$, the battery regulation voltage is reduced by 100 mV or 200 mV based on the value programmed in the TS_VRCG_0 bit within the TS_Setting register.

For devices where the TS function is not needed, tie a 10-k Ω resistor to the TS pin.

There is an active voltage clamp present on this device which will prevent the voltage on the TSMR pin from rising above the VTS_CLAMP threshold. This will particularly be ON when the TSMR pin is floating. The bit TS_OPEN_STAT is set when this clamp is active. This will also be ON regardless of the TS_EN bit. The interrupt is asserted as long as the TS_INT mask is not written.

The bits TS_HOT/TS_COLD, TS_WARM, and TS_COOL will allow these thresholds to be adjusted. The hysteresis will also move along with these thresholds. When the TS_WARM condition occurs, the device will lower the battery target regulation voltage by TS_VRCG but will not modify the VBAT_CTRL register.

The TS_ICHG bit will reduce charging current based on the factor described in the register map when the TSMR pin hits a TS_COOL condition. The TREG function will still be based on this reduced threshold.

The TS_VRCG_0 bit will reduce the charging voltage when the TSMR pin hits the TS_WARM threshold. The factor will be based on the register map.

When the button is detected as pressed (TSMR pin low) during the charging process, charging will be momentarily suspended until the button is high again. When charging is disabled in any of the TS faults, trickle charging is also disabled. In a TS fault where the current is reduced (COOL), the trickle charging current is not altered.

8.3.14 I²C Interface

The BQ21080 device uses a fully compliant I²C interface to program and read control parameters, status bits, and so on. I²C is a 2-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I²C compatible devices connect to the I²C bus through open drain I/O pins, SDA, and SCL. A controller device, usually a micro-controller or a digital signal processor, controls the bus. The controller is responsible for generating the SCL signal and device addresses. The controller also generates specific conditions that indicate the START and STOP of data transfer. A peripheral device receives and transmits data on the bus under control of the controller device.

The BQ21080 works as a peripheral and supports the following data transfer modes, as defined in the I²C Bus Specification: standard mode (100 kbps) and fast mode (400 kbps). The interface adds flexibility to the battery charge solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements.

Register contents remain intact as long as VBAT or VIN voltages remains above their respective UVLO levels.

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as the F/S-mode in this document. The BQ21080 device 7-bit address is 0x6A (shifted 8-bit address is 0xD4).

8.3.14.1 F/S Mode Protocol

The controller initiates a data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 8-6. All I²C-compatible devices should recognize a start condition.

Figure 8-6. START and STOP Condition

The controller then generates the SCL pulses, and transmits the 8-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the controller ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 8-7). All devices recognize the address sent by the controller and compare it to their internal fixed addresses. Only the peripheral device with a matching address generates an acknowledge (see Figure 8-8) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the controller knows that communication link with a peripheral has been established.

Figure 8-7. Bit Transfer on the Serial Interface

The controller generates further SCL cycles to either transmit data to the peripheral (R/W bit 0) or receive data from the peripheral (R/W bit 1). In either case, the receiver needs to acknowledge the data sent by the transmitter. So an acknowledge signal can either be generated by the controller or by the peripheral, depending

on which one is the receiver. The 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary. To signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 8-6). This releases the bus and stops the communication link with the addressed peripheral. All I²C compatible devices must recognize the stop condition. Upon receipt of a stop condition, all devices know that the bus is released, and wait for a start condition followed by a matching address. If a transaction is terminated prematurely, the controller needs to send a STOP condition to prevent the peripheral I²C logic from remaining in an incorrect state. Attempting to read data from register addresses not listed in this section results in FFh being read out.

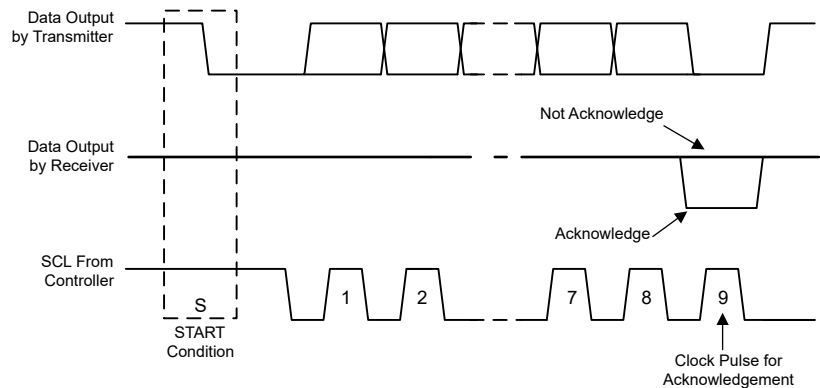

Figure 8-8. Acknowledge on the I²C Bus

Figure 8-9. Bus Protocol

8.4 Device Functional Modes

The BQ21080 has four main modes of operation: Battery Mode, Ship Mode, Charge/Adapter Mode when a supply is connected to IN, and Shutdown mode. The table below summarizes the functions that are active for each operation mode.

Table 8-6. Function Availability Based on Primary Mode of Operation

FUNCTION	CHARGE/ADAPTER MODE	BATTERY MODE	SHIP MODE	SHUTDOWN MODE
Input overvoltage	Yes	Yes	No	No
Input undervoltage	Yes	Yes	Yes	Yes
Battery overcurrent	Yes, if enabled	Yes	Yes, if enabled	No
Battery undervoltage	Yes	Yes	No	No
Input DPM	Yes, if enabled	No	No	No
Dynamic power path management	Yes, if enabled	No	No	No

Table 8-6. Function Availability Based on Primary Mode of Operation (continued)

FUNCTION	CHARGE/ADAPTER MODE	BATTERY MODE	SHIP MODE	SHUTDOWN MODE
BATFET	Yes	Yes	No	No
TS measurement	Yes	No	No	No
Battery charging	Yes, if enabled	No	No	No
ILIM	Yes (Register Value)	No	No	No
Pushbutton input	Yes	Yes, if enabled	Yes	No
INT output	Yes	Yes	No	No
I ² C	Yes	Yes	No	No

8.5 Register Maps

8.5.1 I2C Registers

Table 8-7 lists the memory-mapped registers for the I2C registers. All register offset addresses not listed in Table 8-7 should be considered as reserved locations and the register contents should not be modified.

Table 8-7. I2C Registers

Offset	Acronym	Register Name	Section
0h	STAT0	Charger Status	Section 8.5.1.1
1h	STAT1	Charger Status and Faults	Section 8.5.1.2
2h	FLAG0	Charger Flag Registers	Section 8.5.1.3
3h	VBAT_CTRL	Battery Voltage Control	Section 8.5.1.4
4h	ICHG_CTRL	Fast Charge Current Control	Section 8.5.1.5
5h	CHARGECTRL0	Charger Control 0	Section 8.5.1.6
6h	CHARGECTRL1	Charger Control 1	Section 8.5.1.7
7h	IC_CTRL	IC Control	Section 8.5.1.8
8h	TMR_ILIM	Timer and Input Current Limit Control	Section 8.5.1.9
9h	SHIP_RST	Shipmode, Reset and Pushbutton Control	Section 8.5.1.10
Ah	SYS_REG	SYS Regulation Voltage Control	Section 8.5.1.11
Bh	TS_CONTROL	TS Control	Section 8.5.1.12
Ch	MASK_ID	MASK and Device ID	Section 8.5.1.13

Complex bit access types are encoded to fit into small table cells. Table 8-8 shows the codes that are used for access types in this section.

Table 8-8. I2C Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
RC	R C	Read to Clear
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

8.5.1.1 STAT0 Register (Offset = 0h) [Reset = X]

STAT0 is shown in [Table 8-9](#).

Return to the [Table 8-7](#).

Table 8-9. STAT0 Register Field Descriptions

Bit	Field	Type	Reset	Description

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

A typical application of the BQ21080 consists of the device configured as an I²C controlled single cell Li-ion battery charger and power path manager or battery applications such as smart watches and wireless headsets. A battery thermistor may be connected to the TS pin to allow the device to monitor the battery temperature and control charging as desired.

The system designer may connect the TS/MR pin input to a push button to send interrupts to the host as a button is pressed or to allow the application end user to reset the system.

9.2 Typical Application

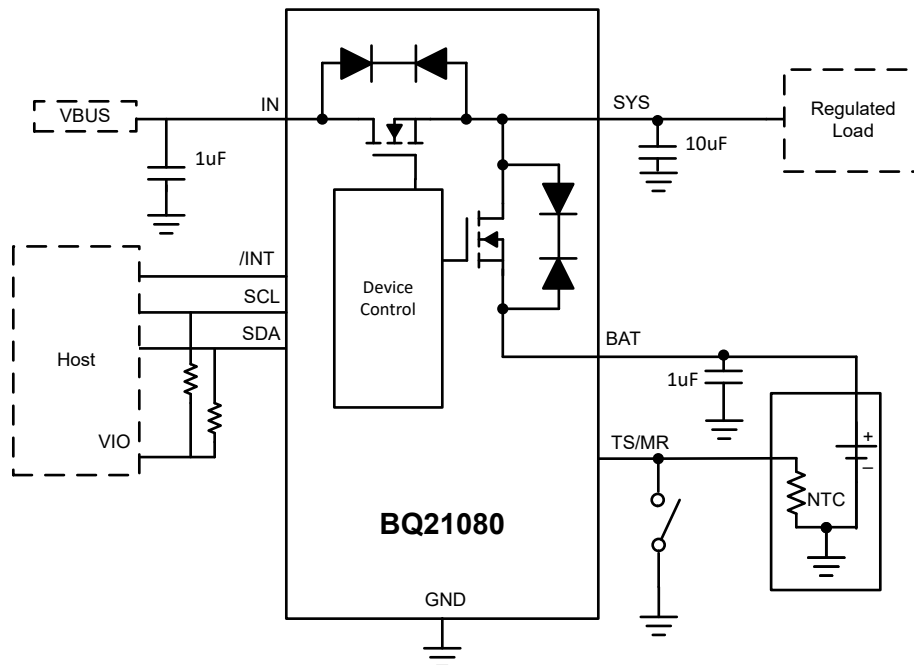

Figure 9-1. Typical Application

9.2.1 Design Requirements

The design requirements for the following design example are shown in [Table 9-1](#).

Table 9-1. Design Parameters

PARAMETER	VALUE
IN supply voltage	5 V
Battery regulation voltage	4.2 V

9.2.2 Detailed Design Procedure

9.2.2.1 Input (IN/SYS) Capacitors

Low ESR ceramic capacitors such as X7R or X5R are preferred for input decoupling capacitors and should be placed as close as possible to the supply and ground pins for the IC. Due to the voltage derating of the capacitors, it is recommended that 25-V rated capacitors are used for the IN and SYS pins which can normally operate at 5 V. After derating the minimum capacitance must be higher than 1 μF .

9.2.2.2 TS

The ground connection for the NTC must be made as close as possible to the GND pin of the device or kelvin connected to it to minimize any error in TS measurement due to IR drops on the ground board lines.

If the system designer does not wish to use the TS function for charging control, a 10-k Ω resistor must be connected from TS to ground.

9.2.2.3 Recommended Passive Components

Table 9-2. Passive Components

		MIN	NOM	MAX	UNIT
C _{SYS}	Capacitance on SYS pin	1	10	100	μF
C _{BAT}	Capacitance on BAT pin	1	1	-	μF
C _{IN}	IN input bypass capacitance	1	1	10	μF

9.2.3 Application Curves

$C_{IN} = 1 \mu\text{F}$, $C_{OUT} = 10 \mu\text{F}$, $V_{IN} = 5 \text{ V}$, $V_{OUT} = 3.8 \text{ V}$, $I_{CHG} = 10 \text{ mA}$ (unless otherwise specified)

Figure 9-20. Long Press Interrupt without VIN Present

10 Power Supply Recommendations

The BQ21080 requires the adapter or IN supply to be between 2.7 V and 5.5 V. The battery voltage must be higher than 3.15 V or V_{BUVLO} to ensure proper operation.

11 Layout

11.1 Layout Guidelines

- To obtain optimal performance, the decoupling capacitor from IN to GND, the capacitor from SYS to GND and BAT to GND should be placed as close as possible to the device, with short trace runs to IN, SYS, BAT and GND. Have solid ground plane that is tied to the GND bump
- The pushbutton GND should be connected close to the device as possible.
- The high current charge paths into IN, SYS and BAT pins must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces.

11.2 Layout Example

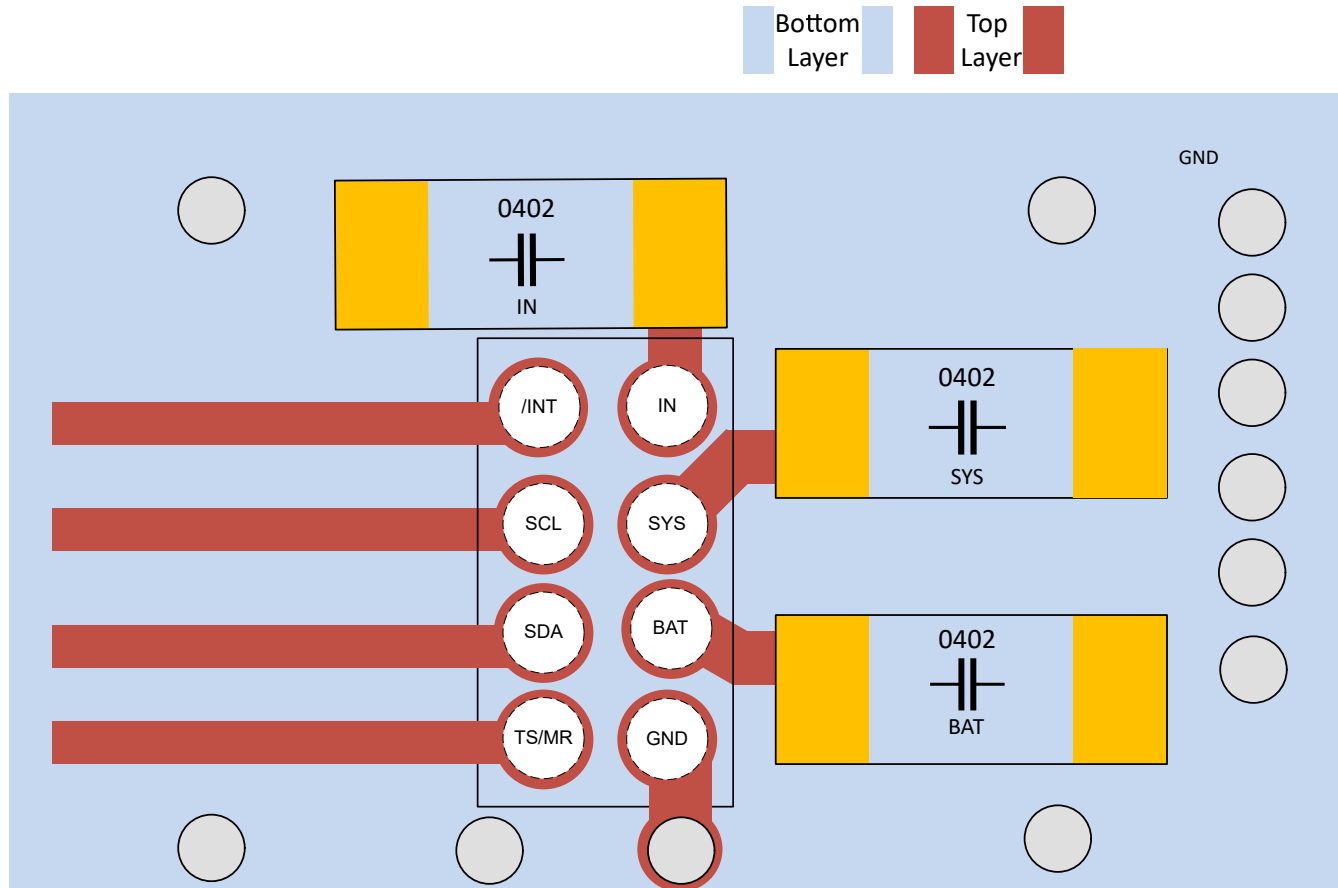

Figure 11-1. Layout Example

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ21080YBGR	ACTIVE	DSBGA	YBG	8	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	B080	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
