Electrical isolation

The Atlas Scientific Gravity™ Analog ORP Sensor / Meter is a very sensitive device and is susceptible to electrical interference from external sources. This interference is caused by micro-voltages entering the water from unnatural sources such as pumps, solenoid valves, or other probes / sensors. When electrical interference is affecting the ORP readings, it is common to see rapidly fluctuating readings or readings that are consistently off. To verify that electrical noise is causing inaccurate readings, place the ORP probe in a cup of water by itself. The readings should stabilize quickly, confirming that electrical noise was the issue.

To stop electrical interference from affecting the readings, Atlas Scientific **strongly recommends** using our [Gravity™ Analog Isolator](#). It is 100% effective at preventing electrical currents in the water from entering the probe and interfering with the readings.

Refer to the [Gravity™ Analog Isolator datasheet](#) for more information about how the isolator works and how to use it.

Calibration

Using the [free downloadable arduino software](#), a one point calibration can be performed. The calibration procedure requires standard 225mV calibration buffers. Any brand of ORP quality calibration buffers can be used.

Higher accuracy

If more accuracy is required, Atlas Scientific offers a wide range of embedded ORP monitoring products that are significantly more accurate than this device.
