1 Introduction

V2DIP2-48 module is designed to allow rapid development of designs using the VNC2-48Q IC. The V2DIP1-48 is supplied as a PCB designed to fit into a 40 pin 0.6" wide, 0.1" pitch DIP socket.The module provides access to the UART, parallel FIFO, and SPI interface pins of the VNC2-48Q device, via its IO bus pins. Two USB ports are accessed via type A USB connectors.

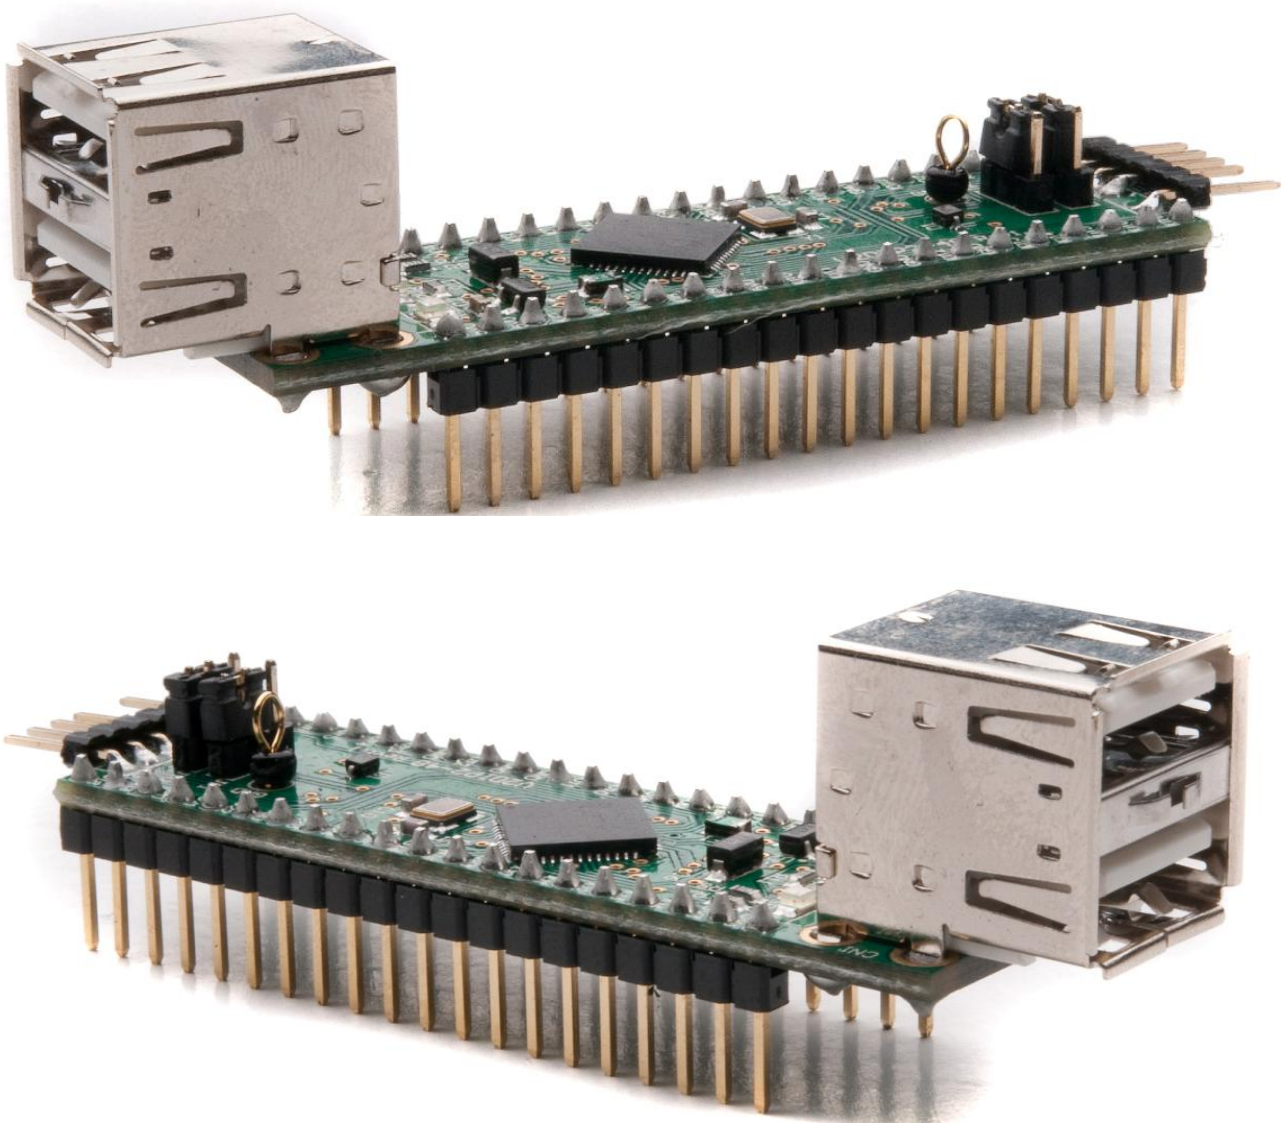

Figure 1.1- V2DIP2 48

The VNC2 is the second of FTDI's Vinculum family of Embedded dual USB host controller devices. The VNC2 device provides USB Host interfacing capability for a variety of different USB device classes including support for BOMS (bulk only mass storage), Printer, HID (human interface devices). For mass storage devices such as USB Flash drives, VNC2 also transparently handles the FAT file structure.

Communication with non USB devices such as a low cost microcontroller is accomplished via either UART, SPI or parallel FIFO interfaces. The VNC2 provides a new cost effective solution for providing USB Host capability into products that previously did not have the hardware resources available.

The VNC2 supports the capability to enable customers to develop custom firmware using the Vinculum II development software tool suite. The development tools support compiler, linker and debugger tools complete within an integrated development environment (IDE).

The Vinculum-II VNC2 family of devices are available in Pb-free (RoHS compliant) 32-lead LQFP, 32-lead QFN, 48-lead LQFP, 48-lead QFN, 64-Lead lQFP and 64-lead QFN packages.

The relevant portion of the V2DIP2-48 module schematic is shown in **Figure 3.3**

Table 3.8 - Asynchronous FIFO Mode Read Cycle Timing

In asynchronous mode an external device can control data transfer driving FIFO_WR# and FIFO_RD# inputs. In contrast to synchronous mode, in asynchronous mode the 245 FIFO module generates the output enable EN# signal. EN# signal is effectively the read signal RD#.

Current byte is available to be read when FIFO_RD# goes low. When FIFO_RD# goes high, FIFO_RXF# output will also go high. It will only become low again when there is another byte to read.

When FIFO_WR# goes low FIFO_TXE# flag will always go high. FIFO_TXE# goes low again only when there is still space for data to be written in to the module.

3.8 Parallel FIFO Interface-Synchronous Mode

The Parallel FIFO Synchronous mode has an eight bit data bus, individual read and write strobes, two hardware flow control signals, an output enable and a clock out.

The synchronous FIFO mode uses the parallel FIFO interface signals detailed in **Table 3.7** and an additional two signals detailed in **Table 3.9**.

Available Pins	*Name*	*Type*	*Description*
J2-8, J2-4, J1-7, J1-14, J1-19, J2-18, J2-13	fifo_oe#	Output	FIFO Output Enable

3.8.1 Timing Diagram – Synchronous FIFO Mode Read and Write Cycle

When in Synchronous FIFO interface mode, the timing of a read and write operation on the FIFO interface are shown in **Figure 3.5** and **Table 3.10**

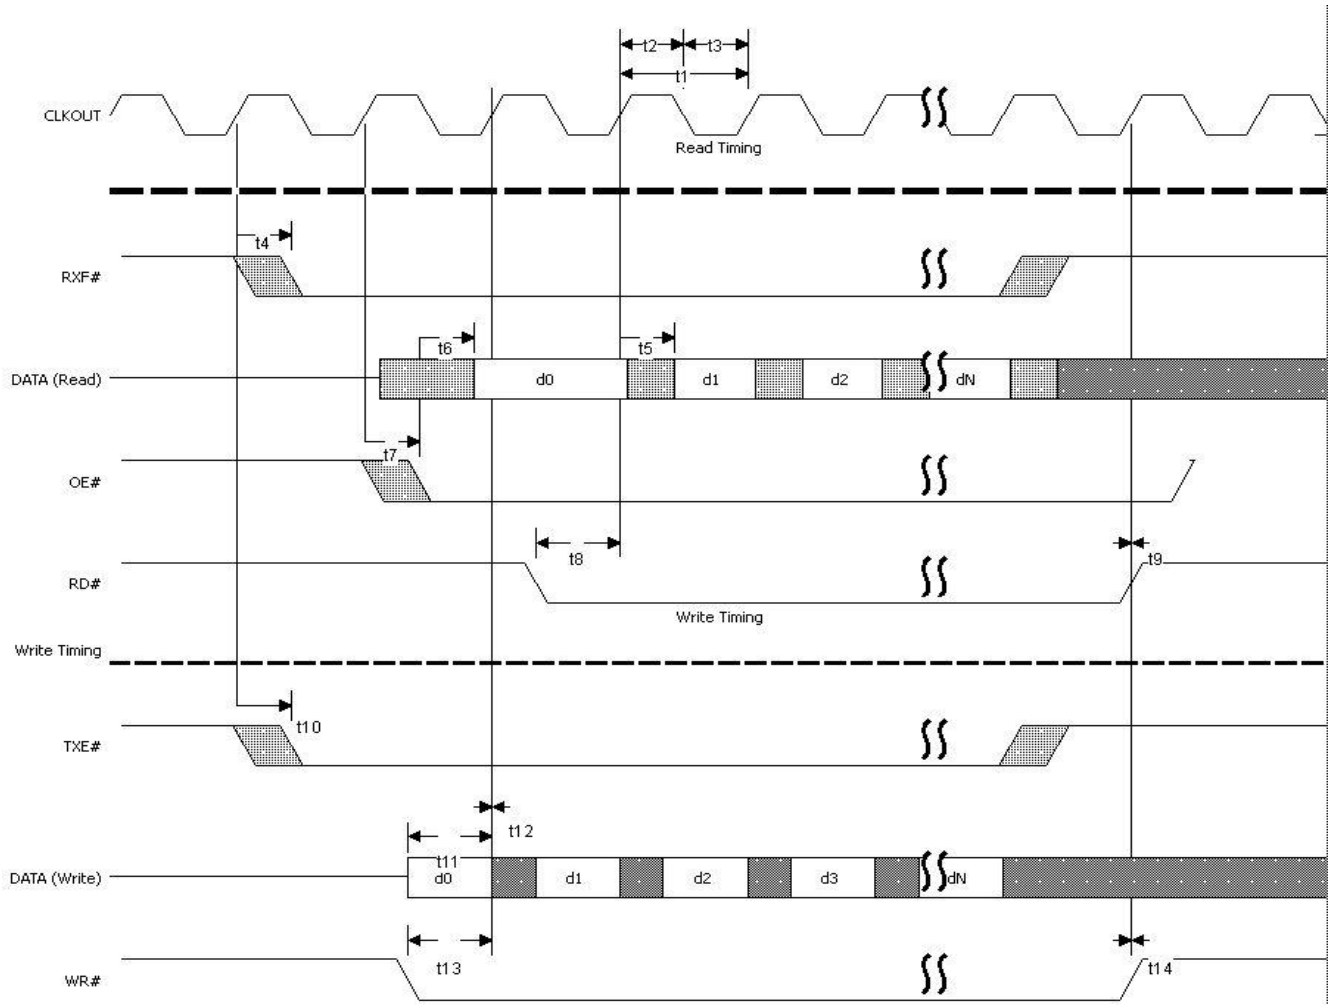

Figure 3.5 - Synchronous FIFO Mode Read and Write Cycle

Time	Description	Min	Typical	Max	Uni
t1	CLKOUT period	-	20.83	-	ns

t8	RD# setup time	12	-	-	ns
t9	RD# hold time	0	-	-	ns
t10	CLKOUT TO TXE#	1	-	-	ns
t11	Write DATA setup time	12	-	-	ns
t12	Write DATA hold time	0	-	-	ns
t13	WR# setup time	12	-	-	ns
t14	WR# hold time	0	-	-	ns

Table 3.10 - Synchronous FIFO Mode Read and Write Cycle Timing

In synchronous mode data can be transmitted to and from the FIFO module on each clock edge. An external device synchronises to the CLKOUT output and it also has access to the output enable OE# input to control data flow. An external device should drive output enable OE# low before pulling RD# line down.

When bursts of data are to be read from the module RD# should be kept low. RXF# remains low when there is still data to be read. Similarly when bursts of data are to be written to the module WR# should be kept low. TXE# remains low when there is still space available for the data to be written

3.9 Debugger Interface

The purpose of the debugger interface is to provide access to the VNC2 silicon/firmware debugger. The debug interface can be accessed by connecting a debug module to the J3 connector. This debug module will give access to the debugger through a USB connection to a PC via the Integrated Development Environment (IDE). The IDE is a graphical interface to the VNC2 software development tool-chain and gives the following debug capabilities through the debugger interface:

- Flash Erase, Write and Program.
- Application debug - application code can have breakpoints, be single stepped and can be halted.
- Detailed internal debug - memory and register read/write access.

The Debugger Interface, and how to use it, is further described in the following applications Note Vinculum-II Debug Interface Description
