NCS2584

Four-Channel Video Driver with Load Detection and Signal Detection

The NCS2584 is a 4−channel high speed video driver with 6th order Butterworth Reconstruction filters on each channel. A first set of 3−channel has High Definition (HD) 34 MHz filters, one per channel. A fourth channel offers an extra driver for Cvbs−type video signal with an 8 MHz filter. The NCS2584 is in fact a combination of a triple HD video driver plus a single Cvbs video driver.

In addition, this four channel video driver integrates an auto shutdown function in order to detect the moment when the DAC is turned on or off. It also embeds a load detection to lower the power consumption when the TV is unplugged. To further reduce the layout and software complexity, the NCS2584 will automatically turn off without any external command. These features help significantly the systems like Blu−Ray™ players or Set Top Boxes to be in line with the restricting energy saving standards on standby modes.

It is designed to be compatible with Digital−to−Analog Converters (DAC) embedded in most video processors.

All channels can accept DC or AC coupled signals. In case of AC−coupled inputs, the internal clamps are enabled. The outputs can drive both AC and DC coupled 150 Ω loads but also two loads of 150 Ω in parallel.

Features

- 3 High Definition Filters with 6_{th} Order Butterworth Filter and 34 MHz Bandwidth for YPbPr 1080i
- One Cvbs Driver Including 6th Order Butterworth 8 MHz Filter
- Integrated Automatic Shutdown Function to Improve Power Consumption Savings When the DAC is Off
- Integrated Load Detection for TV Presence
- Low Pin Count for Layout Simplification
- Internal Fixed Gain: 6 dB ± 0.2
- AC or DC Coupled Inputs and Outputs
- Each channel Capable to Drive 2 Loads of 150 Ω in Parallel
- Operating Supply Voltage Range: +3.3 V and 5.0 V
- TSSOP14 Package
- These Devices are Pb−Free, Halogen Free/BFR Free and are RoHS Compliant
Typical Application

- Set Top Box Decoder
- DVD and Blu−Ray Player / Recorder
- HDTV, Home Theatre

TSSOP−14 PIN DESCRIPTION

Pin No.	Name	Type	Description
1	Cvbs IN	Input	Cvbs Input Channel
2	HD IN1	Input	High Definition Input 1
3	HD IN2	Input	High Definition Input 2
4	HD IN3	Input	High Definition Input 3
5	GND	Ground	Ground
6	NC	NC	No Connection
7	NC	NC	No Connection
8	NC	NC	No Connection
9	NC	NC	No Connection
10	VCC	Power	Power Supply 3.3 V or 5 V
11	HD OUT3	Output	High Definition Output 3
12	HD OUT2	Output	High Definition Output 2
13	HD OUT1	Output	High Definition Output 1
14	Cvbs OUT	Output	Cvbs Output Channel

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Power Supply Voltages	V_{CC}	$-0.3 \leq V_{CC} \leq 5.5$	Vdc
Input Voltage Range	$V_{I/O}$	$-0.3 \leq V_I \leq V_{CC}$	Vdc
Input Differential Voltage Range	V_{ID}	$-0.3 \leq V_I \leq V_{CC}$	Vdc
Output Current (Indefinitely) per Channel	I_O	40	mA
Maximum Junction Temperature (Note 1)	T_J	150	°C
Operating Ambient Temperature	T_A	-40 to $+85$	°C
Storage Temperature Range	T_{stg}	-60 to $+150$	°C
Thermal Resistance, Junction−to−Air	$R_{\theta JA}$	125	°C/W
ESD Protection Voltage (HBM)	V_{esd}	6000	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.
1. Power dissipation must be considered to ensure maximum junction temperature (T_J) is not exceeded.

Maximum Power Dissipation

The maximum power that can be safely dissipated is limited by the associated rise in junction temperature. For the plastic packages, the maximum safe junction temperature is 150°C. If the maximum is exceeded momentarily, proper circuit operation will be restored as soon as the die temperature is reduced. Leaving the device in the "overheated" condition for an extended period can result in device burnout. To ensure proper operation, it is important to observe the derating curves.

Figure 3. Power Dissipation vs Temperature

APPLICATIONS INFORMATION

The NCS2584 quad video driver has been optimized for Standard and High Definition video applications covering the requirements of the standards Composite video (Cvbs), Component Video (720p/1080i). The three HD channels have 34 MHz filters to cover high definition−like video applications. A fourth channel implements one standard definition filter of 8 MHz bandwidth to drive the Cvbs signal.

In the regular mode of operation, each channel provides an internal voltage−to−voltage gain of 2 from input to output. This effectively reduces the number of external components required as compared to discrete approach

implemented with stand alone op amps. An internal level shifter is employed shifting up the output voltage by adding an offset of 280 mV on the outputs. This prevents sync pulse clipping and allows DC−coupled output to the 150 Ω video load. In addition, the NCS2584 integrates a 6th order Butterworth filter for each. This allows rejection of the aliases or unwanted over-sampling effects produced by the video DAC. Similarly for the case of DVD recorders which use a ADC, this anti−aliasing filter (reconstruction filter) will avoid picture quality issue and will help filtration of parasitic signals caused by EMI interference.
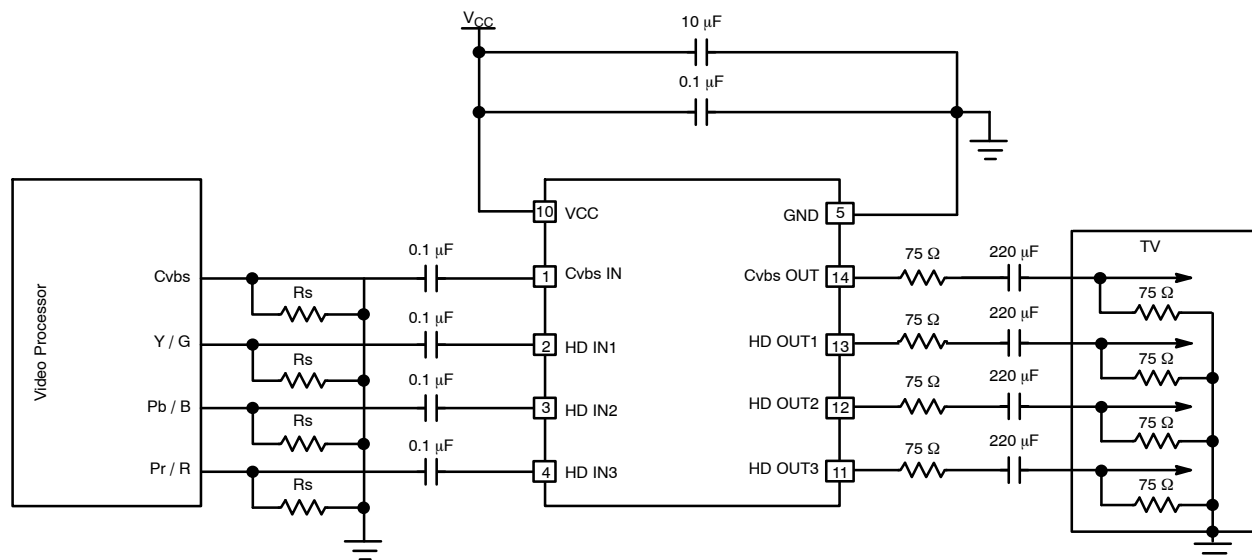

Figure 19. AC−Coupled Configuration at the Input and Output

A built−in diode−like clamp is used into the chip for each channel to support the AC−coupled mode of operation. The clamp is active when the input signal goes below 0 V.

The built−in clamp and level shifter allow the device to operate in different configuration modes depending on the DAC output signal level and the input common mode voltage of the video driver. When the configuration is DC−Coupled at the Inputs and Outputs, the 0.1 μF and 220 μF coupling capacitors are no longer used, and the clamps are in that case inactive; this configuration provides a low cost solution which can be implemented with few external components (Figure 19). It also require the user the ensure the input voltage range stays within 0 V to 1.4 V.

The input is AC−coupled when either the input−signal amplitude goes over the range 0 V to 1.4 V. Activating the clamp becomes mandatory and the use of the 0.1 μF is necessary.

The output AC−coupling configuration is advantageous for eliminating DC ground loop with the drawback of making the device more sensitive to video line or field tilt issues. In some cases, it may be necessary to increase the nominal 220 μF capacitor value. Meanwhile the AC

coupling configuration ensures the maximum compatibility with all sorts of displays.

Shutdown Mode

The NCS2584 integrates a shutdown mode function which allows the device to detect when the video DAC turns on or off. When the video DACs turn ON, the video drivers will turn ON on as soon as they detect a stimulus. Meanwhile if any glitch happens on the input line, embedded filters will ignore them to prevent undesired behavior. In this case, the turn on time is typically around 2 μs to avoid any missing information. When the chipset turns on, it has to go through a boot sequence which is significantly longer than this turn on time. Then, the video drivers will go to a shutdown mode in order to significantly lower the power consumption only when no more stimulus is detected from the video DACs. In addition, the NCS2584 integrates also a load detection function. It only occurs on the Cvbs which is an independent signal and the fist HD channel which contains the synchronization information. It identify when the user plugs the analog video lines of the TV or not. If these are not plugged, then the device goes into a standby mode to reduce the power consumption of the system. The device is in fact

capable of recognizing the load of the TV. With the ENERGY STAR® requirements, these innovative and patented features will perfectly fit with the power saving specifications.

DC−Coupled Output

The outputs of the NCS2584 can be DC−coupled to a 150 Ω load (Figure 20). This has the advantage of eliminating the AC−coupling capacitors at the output by reducing the number of external components and saving space on the board. This can be a key advantage for some applications with limited space.

The problems of field tilt effects on the video signal are also eliminated providing the best video quality with optimal dynamic or peak−to−peak amplitude of the video signal allowing operating thanks to the built−in level shifter without risk of signal clipping. In this coupling configuration the average output voltage is higher than 0 V and the power consumption can be a little higher than with an AC−coupled configuration.
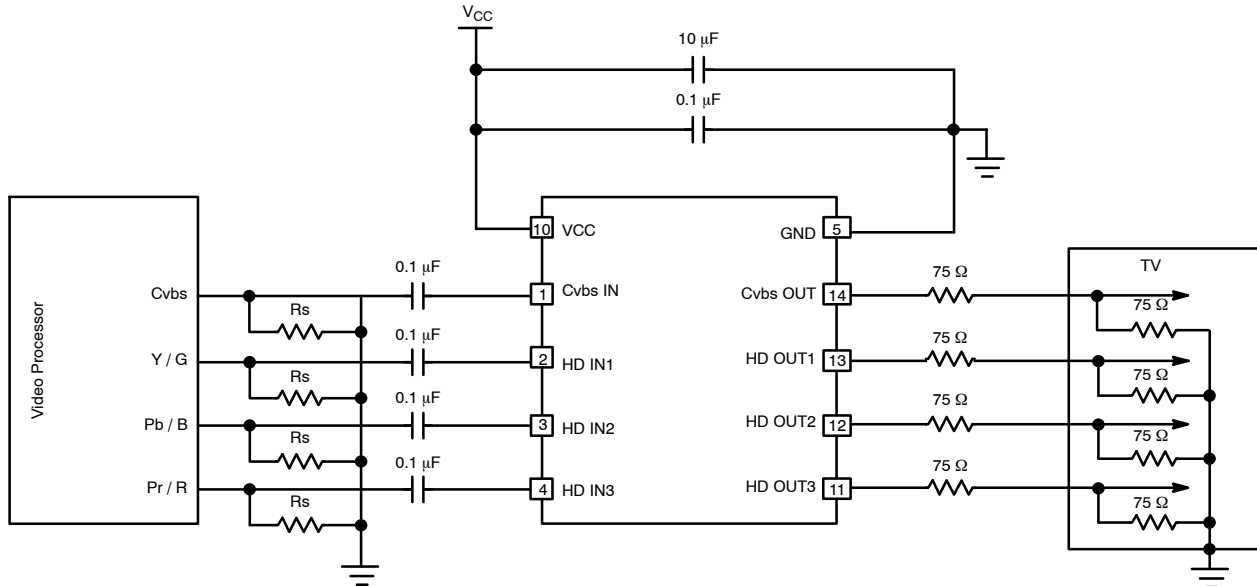

Figure 20. AC−Coupled Input and DC−Coupled Output Configuration
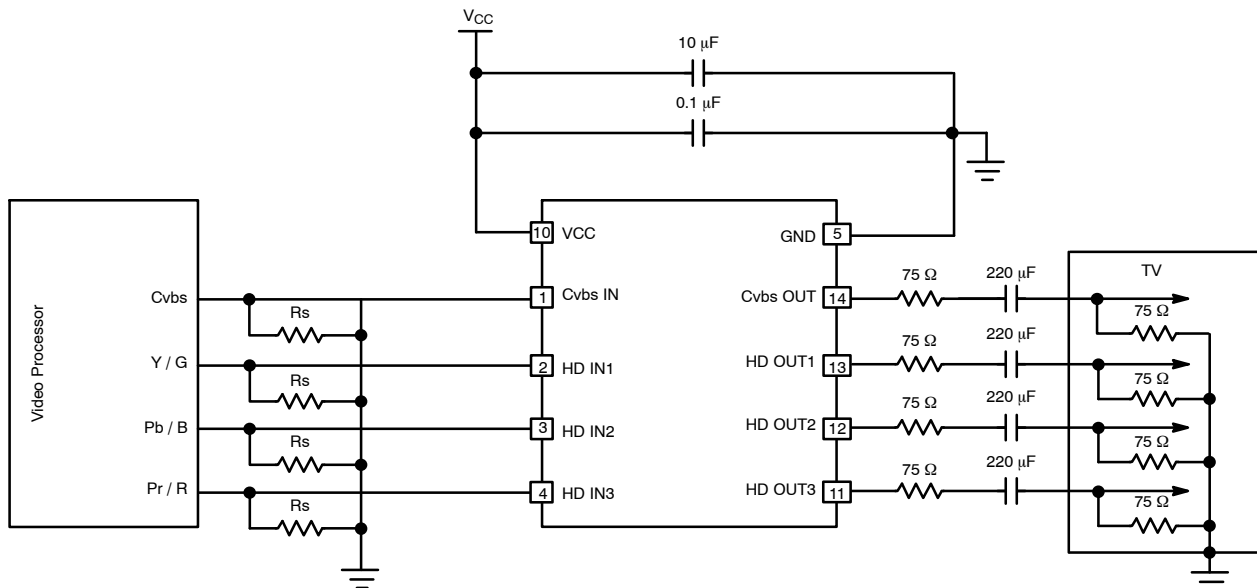

Figure 21. DC−Coupled Inputs and AC−Coupled Outputs
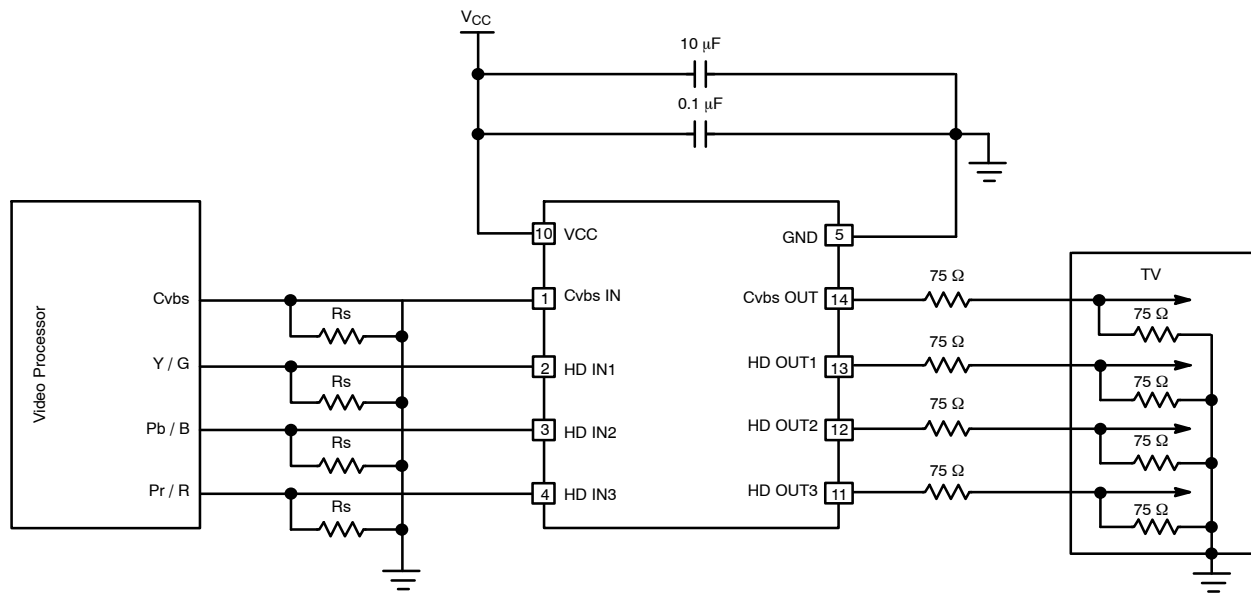

Figure 22. DC−Coupled Inputs and Outputs
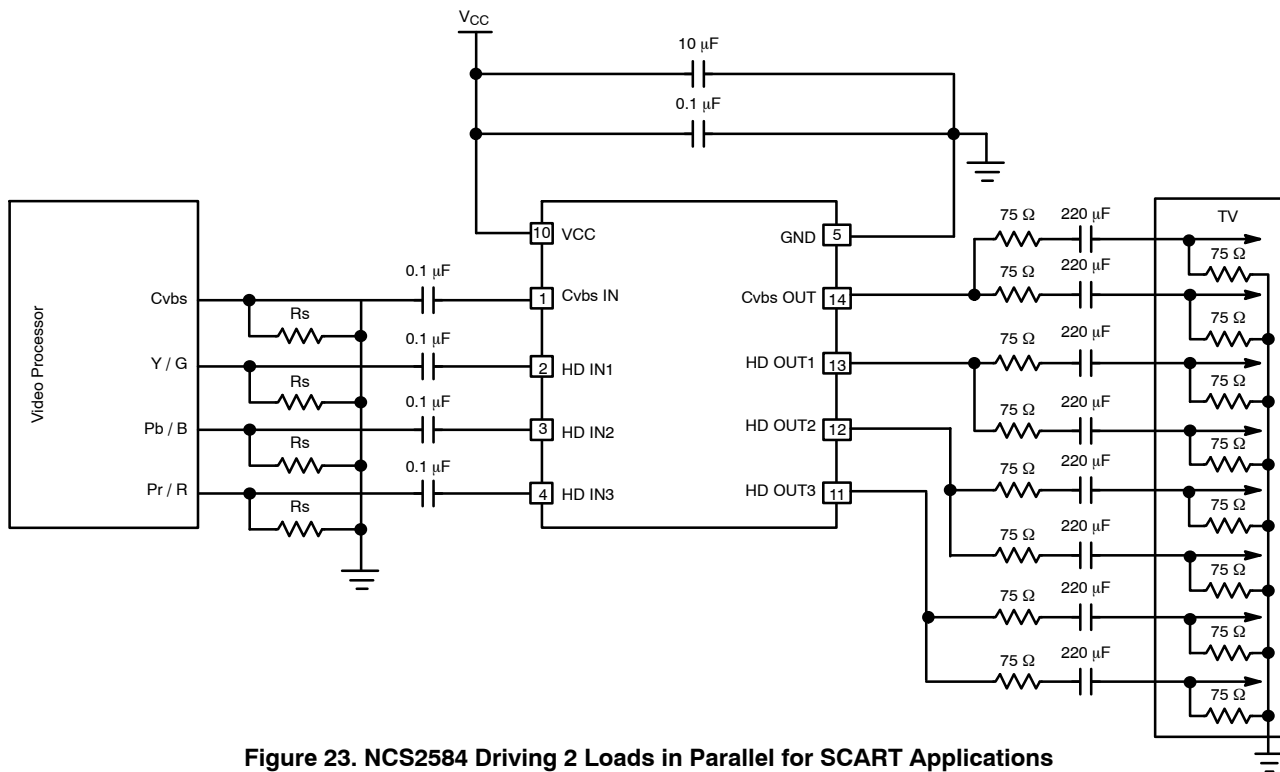

Figure 23. NCS2584 Driving 2 Loads in Parallel for SCART Applications

Video Driving Capability

With an output current capability of 40 mA the NCS2584 was designed to be able to drive at least two video display loads in parallel. This type of application is illustrated in Figure 23. Figure 24 (multiburst) and Figure 25 (linearity) show that the video signal can efficiently drive a 75 Ω equivalent load and not degrade the video performance.

ESD Protection

All the device pins are protected against electrostatic discharge at a level of 6 kV following HBM JEDEC standards. This feature has been considered with a particular attention with ESD structure able to sustain the typical values requested by the systems like Set Top Boxes or Blue−Ray players. This parameter is particularly important for video driver which usually constitutes the last stage in the video chain before the video output connector.
