### Description

The Harris HA-2540 is a wideband, very high slew rate, monolithic operational amplifier featuring superior speed and bandwidth characteristics. Bipolar construction coupled with dielectric isolation allows this truly differential device to deliver outstanding performance in circuits where closed loop gain is 10 or greater. Additionally, the HA-2540 has a drive capability of  $\pm 10\text{V}$  into a 1k $\Omega$  load. Other desirable characteristics include low input voltage noise, low offset voltage, and fast settling time.

A 400V/ $\mu$ s slew rate ensures high performance in video and pulse amplification circuits, while the 400MHz gain-bandwidth product is ideally suited for wideband signal amplification. A settling time of 140ns also makes the HA-2540 an excellent selection for high speed Data Acquisition Systems.

Refer to Application Note 541 and Application Note 556 for more information on High Speed Op Amp applications. HA-2540/883 MIL-STD-883 data sheet is available on request.

For a lower power version of this product, please see the HA-2840 and HA-2850 datasheets.

## NOTES:

- Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
- Maximum power dissipation with load conditions must be designed to maintain the maximum junction temperature below +175°C for the ceramic package, and below +150°C for the plastic package. By using Application Note 556 on Safe Operating Area Equations, along with the packaging thermal resistances listed in the Die Characteristics section, proper load conditions can be determined. Heat sinking is recommended above +75°C with suggested models:  
Thermalloy #6007 ( $\theta_{SA} \approx 40^\circ C/W$ ) or AAVID #5602B ( $\theta_{SA} \approx 16^\circ C/W$ ).
- $R_L = 1k\Omega$ ,  $V_O = \pm 10V$ .
- $V_{CM} = \pm 10V$ .
- $V_O = 90mV$ .
- $A_V = 10$ .
- Full power bandwidth guaranteed based on slew rate measurement using:  $FPBW = \frac{\text{Slew Rate}}{2\pi V_{PEAK}}$ .
- Refer to Test Circuits section of the data sheet.
- $V_{SUPPLY} = +5V, -15V$  and  $+15V, -5V$ .
- Guaranteed range for output voltage is  $\pm 10V$ . Functional operation outside of this range is not guaranteed.

**FIGURE 2. SETTLING TIME TEST CIRCUIT**

- $A_V = -10$ .
- Load Capacitance should be less than 10pF. Turn on time delay typically 4ns.
- It is recommended that resistors be carbon composition and the feedback and summing network ratios be matched to 0.1%.
- SETTLE POINT (Summing Node) capacitance should be less than 10pF. For optimum settling time results, it is recommended that the test circuit be constructed directly onto the device pins. A Tektronix 568 Sampling Oscilloscope with S-3A sampling heads is recommended as a settle point monitor.
