

PD70201EVB25FW-3

3.3V/25W Isolated Active Clamp Forward Converter PD
Evaluation Board User Guide
Revision 1.02

1 About this guide

This user guide provides both description and operation procedures for Microsemi's PD7201EVB25FW-3 evaluating board. This board is used for evaluating the performance of PD70201A PD controller with integrated switching regulator, and PD70224 Dual MOSFET – Based Active Bridge Rectifier.

PD70201ILQ device supports both the standard IEEE802.3at PD application interface, and a PWM controller that is used to provide the PD operational voltage.

The evaluation board supports a 25 Watt, 3.3V output in its existing configuration, with no heat sink.

1.1 Audience

This user guide is intended for qualified personnel, meaning operators and technicians who have a background in basic concepts of electronics.

1.2 Organization

This guide is divided into several sections as follows:

• Chapter 1	About this Guide: Describes the objectives, audience, and organization
• Chapter 2	Introduction: Provides an overview about evaluation board's main functions, features, physical characteristics and ordering information.
• Chapter 3	Physical Description: Provides explanation related to the physical description (switches, jumpers, connectors).
• Chapter 4	Electrical Characteristics: Provides electrical characteristics of the evaluation board.
• Chapter 5	Installation: Provides description of the installation process.
• Chapter 6	Test Data: Provides board test data information
• Chapter 7	Schematic: Provides board schematic diagram
• Chapter 8	List of Material: Provides board's list of materials.
• Chapter 9	Board Layout: Provides board Gerber files description for all layers.

1.3 Reference Documents

PD70201 datasheet, catalogue number DS_PD70201

PD70224 datasheet, catalogue number DS_PD70224

2 Introduction

Microsemi's PD70201ILQ device is part of a family of devices which are targeted for realizing the 802.3at standard PD interface.

The PD interface family of devices includes the following:

Device type	Power capability	Integrates PWM controller
PD70100	IEEE802.3at Type 1 (IEEE802.3 af level)	No
PD70101	IEEE802.3at Type 1 (IEEE802.3 af level)	Yes
PD70200	IEEE802.3at Type 2	No
PD70201	IEEE802.3at Type 2	Yes
PD70210(A)	2 x IEEE802.3at Type 2 (4 pair) HDBaseT (95W)	No
PD70211	2 x IEEE802.3at Type 2 (4 pair) HDBaseT (95W)	Yes

Microsemi's PD70201EVB25FW-3 Evaluation Board (see Figure 2) provides designers with an environment needed for evaluating the performance and implementation of PD applications based on PD70201 controller.

The board is using a single PD controller, PD70201ILQ, to support the Detection, Class, and Power Supplying phases on the 4 Pairs of the Cat5 cable. The board supports sync detection of the 4 pairs. PD70201ILQ supports the current of the HDBaseT over 4 Pairs, which is more than twice the power of a standard IEEE802.3AT Type 2 interface.

All necessary steps and connection instructions required to install and operate this board are provided within this document.

Figure 2: PD7201EVB25FW-3 Evaluation Board – General View

Evaluation Boards Ordering Information

Microsemi supplies the following Evaluation Board as shown below:

Ordering Number	Description
PD7201EVB25FW-3	2 x IEEE802.3at Type 2 (4 pair) PD based on PD72021 device having 4 pair supply, controlling an isolated Forward converter , having a 3.3V 7.5A output.

2.1 Evaluation Board Features

- Designed to support Data and Spare current by a single PD70201A device
- Power is supplied through the 4-pairs of the Cat5 cable
- Wall Adapter input – Standard Barrel Jack available for connecting to an external 48-54V Wall Adapter.
- Data pass-through connector
- On board AT detected LED indicator
- On board Power Good LED indicator
- $T_A = -40^\circ$ to $+70^\circ\text{C}$
- RoHS compliant

2.2 Physical Characteristics

Table 1 lists evaluation board's physical characteristics.

Table 1: Physical Characteristics

Parameter	Value
Mechanical dimensions in mm	165 x 57 x 20 mm (L x W x H)

3 Physical Description

3.1 Package Contents

Upon opening the Evaluation Board package, verify the following part is included.

If it seems damaged, contact local representative or Microsemi's headquarters.

Package content for standard shipments is:

- PD70201EVB25FW-3 Evaluation Board.
- Wall Adapter Input Cable

3.2 Connectors

The following sections provide both general and detailed information regarding unit's connectors.

3.2.1 Connectors Table

Table 2 lists the Evaluation Board's connectors.

Table 2: Connectors List

#	Connector	Name	Description
1	J1	Magjack	RJ45 port for Data + Power In for PSE connection
2	J2	Wall Adapter Input	Standard Barrel Jack used for 48V Wall Adapter. Wall adapter connection will be automatically sensed and will override the PSE power connected to J1.
3	J3	Converter Output	Screw terminals for easy connecting a load to 3.3V output.
4	J4	RJ45 Connector	An RJ45 port for Data pass – through output

3.2.2 Connectors Detailed Explanation

(The numbering is in reference to the numbers listed in Table 2.)

1. RJ45 Connectors.

See Figure 3.

Table 3: RJ45 Connectors

J1 & J4 Pin No	Signal Name	Description
J1 - 1, 2	Data and Power In	Data and power input to powered device (PoE Master Negative data port)
J1 - 3, 6	Data and Power In	Data and power input to powered device (PoE Master Positive data port)
J1 - 4, 5	Data and Power In	Data and power input to powered device (PoE Master Positive data port)
J1 - 7, 8	Data and Power In	Data and power input to powered device (PoE Master Negative data port)

Microsemi

PD7201EVB25FW-3

25W Isolated Forward Converter PD

Evaluation Board

J1 & J4 Pin No	Signal Name	Description
J4 - 1, 2	Data Output	Isolated data pass-through to external monitoring device.
J4 - 3, 6	Data Output	Isolated data pass-through to external monitoring device.
J4 - 4, 5	Data Output	Isolated data pass-through to external monitoring device.
J4 - 7, 8	Data Output	Isolated data pass-through to external monitoring device.

Figure 3: Front RJ45 and Auxiliary 48V Wall Adapter Connectors

2. Wall Adapter Connections

See Figure 3.

J2 Pin No	Signal Name	Description
Center Pin	VIN (+)	42V to 57V input from wall adapter.
Outer Barrel	VIN (-)	Wall Adapter Return

3. V_{out} Connections

See Figure 4.

Table 4: Output Load Connections

Pin No.	Signal Name	Description
J3 - 2	Vout (-)	Return of DC-DC output voltage
J3 - 1	Vout (+)	Positive DC-DC output voltage

Figure 4: V_{out} Connections

3.3 Indications

The following sections provide general information regarding unit's indications.

3.3.1 LED Indication

See Figure 5.

D16 is the AT_FLAG indication LED, a PD70201 device output signal indicating the device has detected a 2 finger class event from the PSE side in the class stage.

D5 is the Power Good indication, a PD70201 device output signal indicating presence of PoE power.

D14 is the input power indicator, indication power presence from either PoE or auxiliary source (wall adapter).

Figure 5: LED Indications

4 Electrical Characteristics

Evaluation board's electrical characteristics are described below:

Table 5: Electrical Characteristics

Parameter		Min	Max	
Main DC Supply – J1, VIN+, VINRTN		42*	57	V
Wall Adapter Supply – J2, VIN+, VINRTN		42	57	V
Output voltage		3.25	3.40	V
Maximum Output Current			7.5	A
Port Isolation to Chassis		-	1.5	kVrms

*After start-up, the minimum voltage is 37V with load \leq 13W per IEEE specification.

5 Installation

5.1 Preliminary Considerations and Safety Precautions

- If using an external supply in place of a PSE, verify the external power supply is turned “off” before all peripheral devices are connected. Insure the external supply is connected to the RJ45 input (J1) per Table 3.

5.2 Initial Configuration

Note: It is important to verify evaluation board is setup as shown in Figure 6 prior to starting any operation.

1. Connect load to evaluation board (J3 -1 (+) & J3 – 2 (-), or TP17 (+) & TP16 (-)).
2. Connect a Cat5 cable from PSE to Evaluation Board (J1), or a 48V Wall Adapter to Evaluation Board (J2).
Note: Wall Adapter will override power from PSE.

Figure 6: Test Setup

6 Test Data

This chapter describes typical EVB test data under various loads and POE input voltage levels.

The efficiency is indicated up to 15A output load current.

Overall efficiency is measured at the input to the bridge. It does not include system-level components (input/output connectors, data transformer, and EMI filter).

$$Eff = \frac{V_{out} * I_{out}}{V_{in} * I_{in}}$$

DC-DC efficiency is measured after the PD chip.

6.1 Efficiency vs. Input Voltage to the bridge at full load (7.5A)

Figure 7: Efficiency vs. Input Voltage

6.2 Efficiency vs. Load Current at 48V Input to the bridge

Figure 8: Efficiency at 48V Input

6.3 Efficiency vs. ambient temperature at 48V input to the bridge at full load

Figure 9: Efficiency vs. temperature at 48V Input

6.4 Output Ripple measured with 20 MHz bandwidth

Figure 10: Full Load Voltage Ripple and Noise at 48V Input (100mV/div)

Figure 11. Proper ripple measurement

6.5 Bode Plots at full load at 48V input

Figure 12. Bode plots (gain and phase)
 Phase margin: 70° , gain margin: -12dB.

6.6 Step Load Response for transitions between 15% and 100% load at 48V input

Figure 13: Load Step Response (100mV/div)
