PI6LC48C51

Ethernet / SATA LVCMOS Clock Generator

Features

- Single LVCMOS output
- Supports 70MHz - 170MHz output frequency range
- RMS phase jitter @ 155.52MHz, (1.875MHz – 20MHz): 0.2ps (typical)
- Full 3.3V or 2.5V supply modes
- Industrial ambient operating temperature
- Available in lead-free package: 8-TSSOP

Description

The PI6LC48C51 is a single LVCMOS output synthesizer optimized to generate Ethernet, SONET/SDH, or SATA reference clock frequencies and is a member of Pericom's HiFlex family of high performance clock solutions. Using a MHz crystal with different frequencies, It can generate various output frequencies with very low phase jitter.

It is ideal for Ethernet, SONET/SDH, and SATA/SAS interfaces in all kind of systems.

Applications

- Networking systems
- SONET / SDH systems
- Server / Storage Systems

Maximum Ratings (Over operating free-air temperature range)

Storage Temperature..... -65°C to+155°C
Ambient Temperature with Power Applied.....-40°C to+85°C
3.3V Analog Supply Voltage.....-0.5 to +3.6V
ESD Protection (HBM) 2000V

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

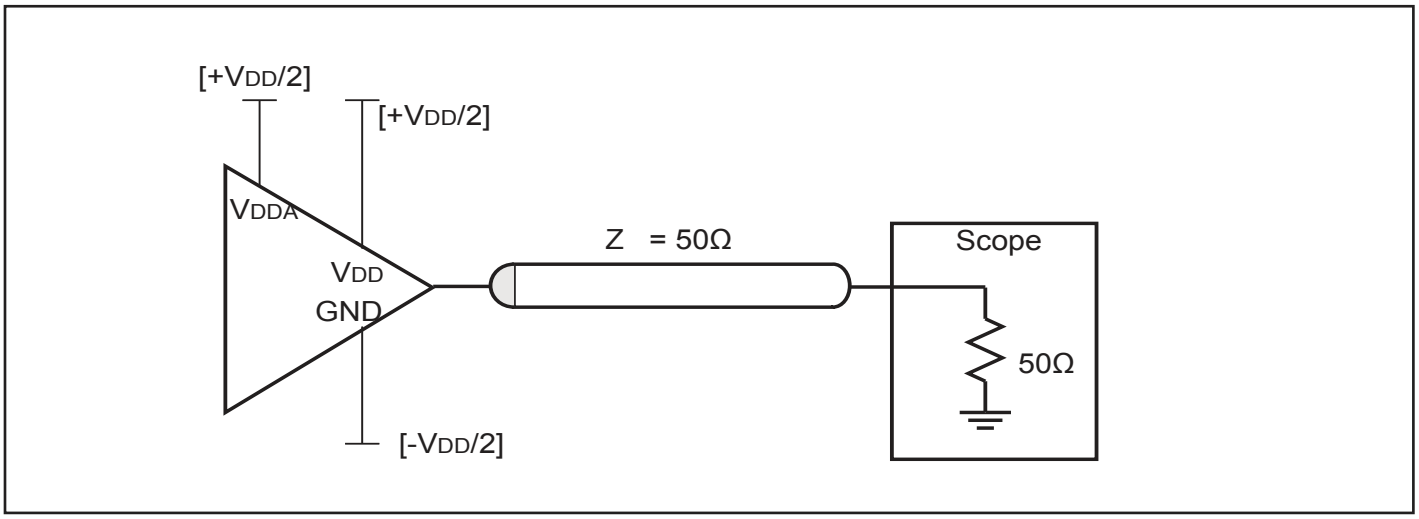
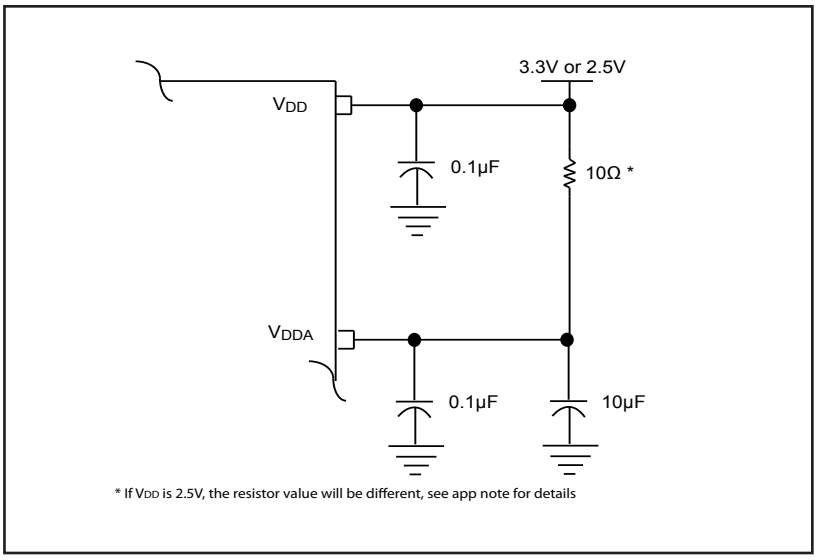
LVCMOS Test Circuit



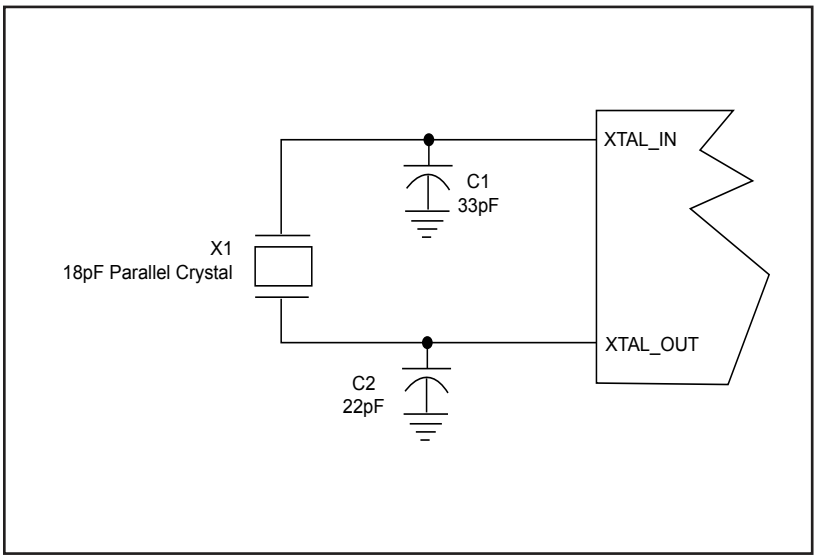
Power Supply Filtering Techniques

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The PI6LC48C51 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} and V_{DDA} should be individually connected to the power supply plane through vias, and 0.1µF bypass capacitors should be used for each pin. Figure below illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a 10µF bypass capacitor be connected to the V_{DDA} pin.



Crystal Input Interface

The clock generator has been characterized with 18pF parallel resonant crystals. The capacitor values shown in the figure below were determined using a 17.5~21.25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error.



LVCMOS to XTAL Interface

The XTAL_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in the figure below. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVCMOS signals, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output impedance of the driver (Ro) plus the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of the two ways. First, R1 and R2 in parallel should equal the transmission line empedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and making R2 50Ω. By overdriving the crystal oscillator, the device will be functional, but note, the device performance is quaranteed by using a quartz crystal.
