

2.7-V TO 5.5-V, 12-BIT QUAD DAC IN WAFER CHIP SCALE PACKAGE

FEATURES

- Four 12-Bit D/A Converters
- Programmable Settling Time of Either 3 μ s or 9 μ s Typ
- TMS320™ DSP Family, (Q)SPI™, and Microwire™ Compatible Serial Interface
- Internal Power-On Reset
- Low Power Consumption:
 - 8 mW, Slow Mode – 5-V Supply
 - 3.6 mW, Slow Mode – 3-V Supply
- Reference Input Buffer
- Voltage Output Range . . . 2 \times the Reference Input Voltage
- Monotonic Over Temperature
- Dual 2.7-V to 5.5-V Supply (Separate Digital and Analog Supplies)
- Hardware Power Down (10 nA)
- Software Power Down (10 nA)
- Simultaneous Update

APPLICATIONS

- Battery Powered Test Instruments
- Digital Offset and Gain Adjustment
- Industrial Process Controls
- Machine and Motion Control Devices
- Communications
- Arbitrary Waveform Generation

DESCRIPTION

The TLV5614IYE is a quadruple 12-bit voltage output digital-to-analog converter (DAC) with a flexible 4-wire serial interface. The serial interface allows glueless interface to TMS320, SPI, QSPI, and Microwire serial ports. The TLV5614IYE is programmed with a 16-bit serial word comprised of a DAC address, individual DAC control bits, and a 12-bit DAC value. The device has provision for two supplies: one digital supply for the serial interface (via pins DV_{DD} and DGND), and one for the DACs, reference buffers, and output buffers (via pins AV_{DD} and AGND). Each supply is independent of the other, and can be any value between 2.7 V and 5.5 V. The dual supplies allow a typical application where the DAC is controlled via a microprocessor operating on a 3 V supply (also used on pins DV_{DD} and DGND), with the DACs operating on a 5 V supply. Of course, the digital and analog supplies can be tied together.

The resistor string output voltage is buffered by a x2 gain rail-to-rail output buffer. The buffer features a Class AB output stage to improve stability and reduce settling time. A rail-to-rail output stage and a power-down mode makes it ideal for single voltage, battery based applications. The settling time of the DAC is programmable to allow the designer to optimize speed versus power dissipation. The settling time is chosen by the control bits within the 16-bit serial input string. A high-impedance buffer is integrated on the REFINAB and REFINCD terminals to reduce the need for a low source impedance drive to the terminal. REFINAB and REFINCD allow DACs A and B to have a different reference voltage than DACs C and D.

The TLV5614IYE is implemented with a CMOS process and is available in a 16-terminal WCS package. The TLV5614IYE is characterized for operation from –40°C to 85°C in a wire-bonded small outline (SOIC) package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

FUNCTIONAL BLOCK DIAGRAM

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
AGND	9		Analog ground
AV _{DD}	16		Analog supply
$\overline{\text{CS}}$	6	I	Chip select. This terminal is active low.
DGND	8		Digital ground
DIN	4	I	Serial data input
DV _{DD}	1		Digital supply
FS	7	I	Frame sync input. The falling edge of the frame sync pulse indicates the start of a serial data frame shifted out to the TLV5614IYE.
$\overline{\text{PD}}$	2	I	Power down pin. Powers down all DACs (overriding their individual power down settings), and all output stages. This terminal is active low.
$\overline{\text{LDAC}}$	3	I	Load DAC. When the LDAC signal is high, no DAC output updates occur when the input digital data is read into the serial interface. The DAC outputs are only updated when LDAC is low.
REFINAB	15	I	Voltage reference input for DACs A and B.
REFINCD	10	I	Voltage reference input for DACs C and D.
SCLK	5	I	Serial clock input
OUTA	14	O	DACA output
OUTB	13	O	DACB output
OUTC	12	O	DACC output
OUTD	11	O	DACD output

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted⁽¹⁾

	UNIT
Supply voltage, (DV _{DD} , AV _{DD} to GND)	7 V
Supply voltage difference, (AV _{DD} to DV _{DD})	-2.8 V to 2.8 V
Digital input voltage range	-0.3 V to DV _{DD} + 0.3 V
Reference input voltage range	-0.3 V to AV _{DD} + 0.3 V
Operating free-air temperature range, T _A	-40°C to 85°C

⁽¹⁾ Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

	MIN	NOM	MAX	UNIT		
Supply voltage, AV _{DD} , DV _{DD}	5-V supply	4.5	5	5.5	V	
	3-V supply	2.7	3	3.3

Power down supply current (see Figure 12)				10		nA

- The relative accuracy or integral nonlinearity (INL) sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.
- The differential nonlinearity (DNL) sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
- Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
- Zero-scale-error temperature coefficient is given by: $EZS\ TC = [EZS(T_{max}) - EZS(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
- Gain error is the deviation from the ideal output ($2 V_{ref} - 1\ LSB$) with an output load of 10 kΩ excluding the effects of the zero-error.
- Gain temperature coefficient is given by: $EG\ TC = [EG(T_{max}) - EG(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
- Zero-scale-error rejection ratio (EZS-RR) is measured by varying the AV_{DD} from $5 \pm 0.5\ V$ and $3 \pm 0.3\ V$ dc, and measuring the proportion of this signal imposed on the zero-code output voltage.
- Full-scale rejection ratio (EG-RR) is measured by varying the AV_{DD} from $5 \pm 0.5\ V$ and $3 \pm 0.3\ V$ dc and measuring the proportion of this signal imposed on the full-scale output voltage after subtracting the zero scale change.
- Reference input voltages greater than V_{DD}/2 cause output saturation for large DAC codes
- Reference feedthrough is measured at the DAC output with an input code = 000 hex and a V_{ref} (REFINAB or REFINCD) input = 1.024 Vdc + 1 V_{pp} at 1 kHz.

ELECTRICAL CHARACTERISTICS (CONTINUED)

ANALOG OUTPUT DYNAMIC PERFORMANCE						
PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SR	Output slew rate	$C_L = 100 \text{ pF}$, $R_L = 10 \text{ k}\Omega$, $V_O = 10\% \text{ to } 90\%$, $V_{ref} = 2.048 \text{ V}$, 1024 V	Fast	5		V/ μs
			Slow	1		V/ μs
t_s	Output settling time	To $\pm 0.5 \text{ LSB}$, $C_L = 100 \text{ pF}$, $R_L = 10 \text{ k}\Omega$, See Notes 1 and 3	Fast	3	5.5	μs
			Slow	9	20	
$t_{s(c)}$	Output settling time, code to code	To $\pm 0.5 \text{ LSB}$, $C_L = 100 \text{ pF}$, $R_L = 10 \text{ k}\Omega$, See Note 2	Fast	1		μs
			Slow	2		
	Glitch energy	Code transition from 7FF to 800		10		nV-sec
SNR	Signal-to-noise ratio	Sinewave generated by DAC, Reference voltage = 1.024 at 3 V and 2.048 at 5 V, $f_s = 400 \text{ KSPS}$, $f_{OUT} = 1.1 \text{ kHz}$ sinewave, $C_L = 100 \text{ pF}$, $R_L = 10 \text{ k}\Omega$, $BW = 20 \text{ kHz}$		74		dB
S/(N+D)	Signal to noise + distortion			66		
THD	Total harmonic distortion			-68		
SFDR	Spurious free dynamic range			70		
DIGITAL INPUT TIMING REQUIREMENTS						
$t_{su}(CS-FS)$	Setup time, \overline{CS} low before FS \downarrow		10			ns
$t_{su}(FS-CK)$	Setup time, FS low before first negative SCLK edge		8			ns
$t_{su}(C16-FS)$	Setup time, sixteenth negative SCLK edge after FS low on which bit D0 is sampled before rising edge of FS		10			ns
$t_{su}(C16-CS)$	Setup time. The first positive SCLK edge after D0 is sampled before \overline{CS} rising edge. If FS is used instead of the SCLK positive edge to update the DAC, then the setup time is between the FS rising edge and \overline{CS} rising edge.		10			ns
t_{wH}	Pulse duration, SCLK high		25			ns
t_{wL}	Pulse duration, SCLK low		25			ns
$t_{su}(D)$	Setup time, data ready before SCLK falling edge		8			ns
$t_h(D)$	Hold time, data held valid after SCLK falling edge		5			ns
$t_{wH}(FS)$	Pulse duration, FS high		20			ns

- (1) Settling time is the time for the output signal to remain within $\pm 0.5 \text{ LSB}$ of the final measured value for a digital input code change of FFF hex to 080 hex for 080 hex to FFF hex.
- (2) Settling time is the time for the output signal to remain within $\pm 0.5 \text{ LSB}$ of the final measured value for a digital input code change of one count.
- (3) Limits are ensured by design and characterization, but are not production tested.

APPLICATION INFORMATION

GENERAL FUNCTION

The TLV5614IYE is a 12-bit single supply DAC based on a resistor string architecture. The device consists of a serial interface, speed and power down control logic, a reference input buffer, a resistor string, and a rail-to-rail output buffer.

The output voltage (full scale determined by external reference) is given by:

$$2 \text{ REF} \frac{\text{CODE}}{2^n} \text{ [V]}$$

where REF is the reference voltage and CODE is the digital input value within the range of 0_{10} to 2^n-1 , where $n=12$ (bits). The 16-bit data word, consisting of control bits and the new DAC value, is illustrated in the *data format* section. A power-on reset initially resets the internal latches to a defined state (all bits zero).

SERIAL INTERFACE

Explanation of data transfer: First, the device has to be enabled with $\overline{\text{CS}}$ set to low. Then, a falling edge of FS starts shifting the data bit-per-bit (starting with the MSB) to the internal register on the falling edges of SCLK. After 16 bits have been transferred or FS rises, the content of the shift register is moved to the DAC latch, which updates the voltage output to the new level.

The serial interface of the TLV5614IYE can be used in two basic modes:

- Four wire (with chip select)
- Three wire (without chip select)

Using chip select (four wire mode), it is possible to have more than one device connected to the serial port of the data source (DSP or microcontroller). The interface is compatible with the TMS320™ DSP family. Figure 15 shows an example with two TLV5614IYEs connected directly to a TMS320 DSP.

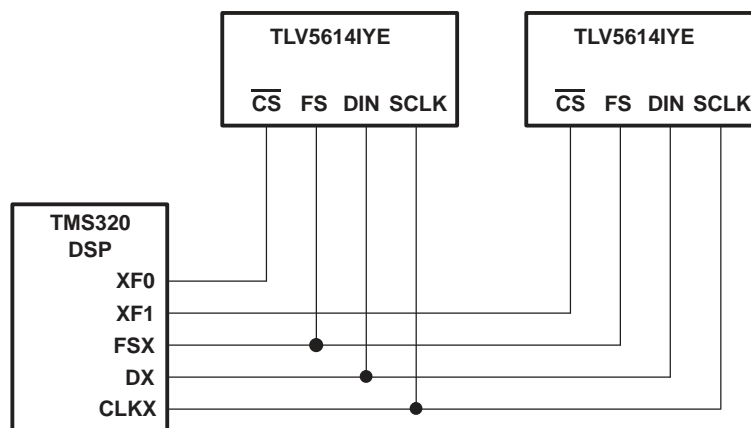

Figure 15. TMS320 Interface

TLV5614IYE

SLAS391A – JULY 2003 – REVISED AUGUST 2003

If there is no need to have more than one device on the serial bus, then $\overline{\text{CS}}$ can be tied low. Figure 16 shows an example of how to connect the TLV5614IYE to a TMS320, SPI, or Microwire port using only three pins.

Figure 16. Three-Wire Interface

Notes on SPI and Microwire: Before the controller starts the data transfer, the software has to generate a falling edge on the I/O pin connected to FS. If the word width is 8 bits (SPI and Microwire), two write operations must be performed to program the TLV5614IYE. After the write operation(s), the DAC output is updated automatically on the next positive clock edge following the sixteenth falling clock edge.

SERIAL CLOCK FREQUENCY AND UPDATE RATE

The maximum serial clock frequency is given by:

$$f_{\text{SCLKmax}} = \frac{1}{t_{\text{wH(min)}} + t_{\text{wL(min)}}} = 20 \text{ MHz}$$

The maximum update rate is:

$$f_{\text{UPDATEmax}} = \frac{1}{16 (t_{\text{wH(min)}} + t_{\text{wL(min)}})} = 1.25 \text{ MHz}$$

Note that the maximum update rate is a theoretical value for the serial interface since the settling time of the TLV5614IYE has to be considered also.

DATA FORMAT

The 16-bit data word for the TLV5614IYE consists of two parts:

- Control bits (D15 . . . D12)
- New DAC value (D11 . . . D0)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
A1	A0	PWR	SPD	New DAC value (12 bits)											

X: don't care

SPD: Speed control bit. 1 → fast mode 0 → slow mode

PWR: Power control bit. 1 → power down 0 → normal operation

In power-down mode, all amplifiers within the TLV5614IYE are disabled. A particular DAC (A, B, C, D) of the TLV5614IYE is selected by A1 and A0 within the input word.

A1	A0	DAC
0	0	A
0	1	B
1	0	C
1	1	D

USING TLV5614IYE, WAFER CHIP SCALE PACKAGE (WCSP)

- TLV5614 DIE qualification was done using a wire-bonded small outline (SOIC) package and includes: steady state life, thermal shock, ESD, latch-up, and characterization. This qualified device is orderable as TLV5614ID.
- The wafer chip-scale package (WCS), TLV5614IYE, uses the same DIE as TLV5614ID, but is not qualified. WCS qualification, including board level reliability (BLR), is the responsibility of the customer.
- It is recommended that underfill be used for increased reliability. BLR is application dependent, but may include test such as: temperature cycling, drop test, key push, bend, vibration, and package shear.

The following WCSP information provides the user of the TLV5614IYE with some general guidelines for board assembly.

- Melting point of eutectic solder is 183°C.
- Recommended peak reflow temperatures are in the 220°C to 230°C range.
- The use of underfill is required. The use of underfill greatly reduces the risk of thermal mismatch fails.

Underfill is an epoxy/adhesive that may be added during the board assembly process to improve board level/system level reliability. The process is to dispense the epoxy under the dice after die attach reflow. The epoxy adheres to the body of the device and to the printed-circuit board. It reduces stress placed upon the solder joints due to the thermal coefficient of expansion (TCE) mismatch between the board and the component. Underfill material is highly filled with silica or other fillers to increase an epoxy's modulus, reduce creep sensitivity, and decrease the material's TCE.

The recommendation for peak flow temperatures of 220°C to 230°C is based on general empirical results that indicate that this temperature range is needed to facilitate good wetting of the solder bump to the substrate or circuit board pad. Lower peak temperatures may cause nonwets (cold solder joints).

NOTES:A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.

TLV5614IYE

SLAS391A – JULY 2003 – REVISED AUGUST 2003

TLV5614IYE INTERFACED TO TMS320C203 DSP

Hardware Interfacing

Figure 18 shows an example of how to connect the TLV5614IYE to a TMS320C203 DSP. The serial port is configured in burst mode, with FSX generated by the TMS320C203 to provide the frame sync (FS) input to the TLV5614IYE. Data is transmitted on the DX line, with the serial clock input on the CLKX line. The general-purpose input/output port bits IO0 and IO1 are used to generate the chip select (\overline{CS}) and DAC latch update (\overline{LDAC}) inputs to the TLV5614IYE. The active low power down (\overline{PD}) is pulled high all the time to ensure the DACs are enabled.

Figure 18. TLV5614IYE Interfaced With TMS320C203

Software

The application example outputs a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and its quadrature (cosine) signal as the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses \overline{LDAC} low to update all 4 DACs simultaneously, then fetches and writes the next sample to all 4 DACs. The samples are stored in a look-up table, which describes two full periods of a sine wave.

The synchronous serial port of the DSP is used in burst mode. In this mode, the processor generates an FS pulse preceding the MSB of every data word. If multiple, contiguous words are transmitted, a violation of the $t_{su}(C16-FS)$ timing requirement occurs. To avoid this, the program waits until the transmission of the previous word has been completed.

```

;-----
; Processor:  TMS320C203 running at 40 MHz
;
; Description:
;
; This program generates a differential in-phase (sine) on (OUTA-OUTB) and it's quadrature
; (cosine) as a differential signal on (OUTC-OUTD).
;
; The DAC codes for the signal samples are stored as a table of 64 12-bit values, describing
; 2 periods of a sine function. A rolling pointer is used to address the table location in
; the first period of this waveform, from which the DAC A samples are read. The samples for
; the other 3 DACs are read at an offset to this rolling pointer
; DAC   Function      Offset from rolling pointer
; A     sine          0
; B     inverse sine  16
; C     cosine        8
; D     inverse cosine24
;
; The on-chip timer is used to generate interrupts at a fixed rate. The interrupt service
; routine first pulses LDAC low to update all DACs simultaneously with the values which
; were written to them in the previous interrupt. Then all 4 DAC values are fetched and
; written out through the synchronous serial interface. Finally, the rolling pointer is
; incremented to address the next sample, ready for the next interrupt.

TLV5614IYE INTERFACED TO MCS[®]51 MICROCONTROLLER

Hardware Interfacing

Figure 19 shows an example of how to connect the TLV5614IYE to an MCS[®]51 Microcontroller. The serial DAC input data and external control signals are sent via I/O Port 3 of the controller. The serial data is sent on the RxD line, with the serial clock output on the TxD line. Port 3 bits 3, 4, and 5 are configured as outputs to provide the DAC latch update ($\overline{\text{LDAC}}$), chip select ($\overline{\text{CS}}$) and frame sync (FS) signals for the TLV5614IYE. The active low power down pin ($\overline{\text{PD}}$) of the TLV5614IYE is pulled high to ensure that the DACs are enabled.

Figure 19. TLV5614IYE Interfaced With MCS[®]51

Software

The example is the same as for the TMS320C203 in this data sheet, but adapted for a MCS[®]51 controller. It generates a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and its quadrature (cosine) signal is the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses $\overline{\text{LDAC}}$ low to update all 4 DACs simultaneously, then fetches and writes the next sample to all 4 DACs. The samples are stored as a look-up table, which describes one full period of a sine wave.

The serial port of the controller is used in Mode 0, which transmits 8 bits of data on RxD, accompanied by a synchronous clock on TxD. Two writes concatenated together are required to write a complete word to the TLV5614IYE. The $\overline{\text{CS}}$ and FS signals are provided in the required fashion through control of IO port 3, which has bit addressable outputs.

```

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
TLV5614IYE	ACTIVE	DIESALE	YE	16	120	TBD	Call TI	N / A for Pkg Type
TLV5614IYER	ACTIVE	DIESALE	YE	16	3000	TBD	Call TI	N / A for Pkg Type

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
