

Single-Output LDO Regulators

35 V Voltage Resistance 2 A LDO Regulators

BD00FDAWHFP

Description

The BD00FDAWHFP is low-saturation regulators. The series' output voltages are Variable type. BD00FDAWHFP have a built-in over-current protection circuit that prevents the destruction of the IC due to output short circuits and a thermal shutdown circuit that protects the IC from thermal damage due to overloading.

Features

- Output Current Capability: 2 A
- Output Voltage: Variable
- $\pm 1\%$ High Output Voltage Accuracy ($T_a = 25\text{ }^\circ\text{C}$)
- Low Saturation with PDMOS Output
- Built-in Over-current Protection Circuit that Prevents the Destruction of the IC due to Output Short Circuits
- Built-in Thermal Shutdown Circuit for Protecting the IC from Thermal Damage due to Overloading
- Low ESR Capacitor
- HRP5 Package

Key Specifications

- Supply Voltage ($V_o \geq 3.0\text{ V}$): $V_o + 1.0\text{ V to } 32.0\text{ V}$
- Supply Voltage ($V_o < 3.0\text{ V}$): $4.0\text{ V to } 32.0\text{ V}$
- Output Voltage: $1.5\text{ V to } 30.0\text{ V}$
- Output Current: 2 A
- Output Voltage Precision: $\pm 1\%$ ($T_a = 25\text{ }^\circ\text{C}$)
- Operating Temperature Range: $-40\text{ }^\circ\text{C to } +105\text{ }^\circ\text{C}$

Package

HRP5

W (Typ) x D (Typ) x H (Max)
9.395 mm x 10.540 mm x 2.005 mm

Pin Configuration

Figure 2. Pin Configurations

Pin Description

Pin No.	Pin Name	Function
1	CTL	Control terminal By setting this pin to High, you can turn the device on. By setting this pin to Low, you can turn the device off.
2	Vcc	Input Power source terminal Connect a ceramic capacitor between Vcc and GND. Place the capacitor close to the terminal.
3	GND	Ground It is connected to the FIN terminal at the ground of the circuit.
4	Vo	Output terminal Connect a capacitor between Vo and GND. Place the capacitor close to the terminal. Refer to Operational Notes 15 for capacitance and ESR value.
5	ADJ	Output voltage setting terminal Connect a resistor between Vo and ADJ, ADJ and GND.
FIN	FIN	Heat dissipating FIN It is recommended that FIN is soldered to a copper foil part with a large area. It is electrically connected to GND inside the package.

Block Diagram

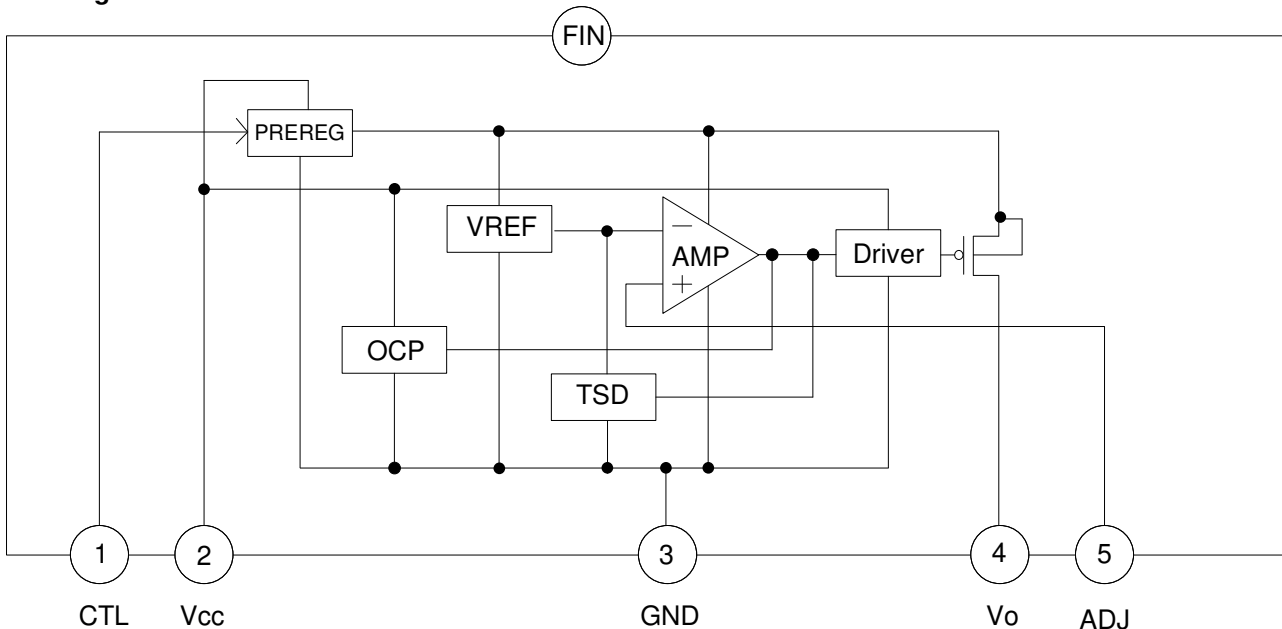

Figure 3. Block Diagram

Description of Blocks

Block Name	Function	Description of Blocks
PREREG	Internal Power Supply	A logical "High" ($V_{thH} \geq 2.0\text{ V}$) at the CTL enables Power Supply for Internal Circuit
TSD	Thermal Shutdown Protection	To protect the device from overheating. If the chip temperature (T_j) reaches ca. $175\text{ }^\circ\text{C}$ (Typ), the output is turned off.
VREF	Reference Voltage	Generate the Reference Voltage
AMP	Error Amplifier	The Error Amplifier amplifies the difference between the feedback voltage of the output voltage and the reference v.
Driver	Output MOS FET Driver	Drive the Output MOS FET
OCP	Over Current Protection	To protect the device from damage caused by over current. If the output current reaches current ability (Typ: 2500 mA), the output is turned off.

Absolute Maximum Ratings

Parameter	Symbol	Ratings	Unit
Supply Voltage ^(Note 1)	V _{CC}	-0.3 to +35.0	V
Output Control Pin Voltage ^(Note 2)	V _{CTL}	-0.3 to +35.0	V
Output Pin Voltage	V _{OUT}	-0.3 to +35.0	V
Operating Temperature Range	T _a	-40 to +105	°C
Storage Temperature Range	T _{stg}	-55 to +150	°C
Maximum Junction Temperature	T _{jmax}	150	°C

(Note 1) Do not exceed T_{jmax}.

(Note 2) The order of starting up power supply (V_{CC}) and CTL pin doesn't have either in the problem within the range of the operation power-supply voltage ahead.

Caution 1: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Caution 2: Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB with thermal resistance taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.

Thermal Resistance^(Note 1)

Parameter	Symbol	Thermal Resistance (Typ)		Unit

Linear Regulators Surge Voltage Protection

The following provides instructions on surge voltage overs absolute maximum ratings polarity protection for ICs.

1. Applying positive surge to the input

If the possibility exists that surges higher than absolute maximum ratings 35 V will be applied to the input, a Zener Diode should be placed to protect the device in between the V_{IN} and the GND as shown in the Figure 19.

Figure 19. Surges Higher than 35 V will be Applied to the Input

2. Applying negative surge to the input

If the possibility exists that surges lower than absolute maximum ratings -0.3 V will be applied to the input, a Schottky Diode should be placed to protect the device in between the V_{IN} and the GND as shown in the Figure 20.

Figure 20. Surges Lower than -0.3 V will be Applied to the Input

Linear Regulators Reverse Voltage Protection

A linear regulator integrated circuit (IC) requires that the input voltage is always higher than the regulated voltage. Output voltage, however, may become higher than the input voltage under specific situations or circuit configurations, and that reverse voltage and current may cause damage to the IC. A reverse polarity connection or certain inductor components can also cause a polarity reversal between the input and output pins. The following provides instructions on reversed voltage polarity protection for ICs.

1. About Input/Output Voltage Reversal

In an MOS linear regulator, a parasitic element exists as a body diode in the drain-source junction portion of its power MOSFET. Reverse input/output voltage triggers the current flow from the output to the input through the body diode. The inverted current may damage or destroy the semiconductor elements of the regulator since the effect of the parasitic body diode is usually disregarded for the regulator behavior (Figure 21).

Figure 21. Reverse Current Path in an MOS Linear Regulator

1. About Input/Output Voltage Reversal - continued

An effective solution to this is an external bypass diode connected in-between the input and output to prevent the reverse current flow inside the IC (see Figure 22). Note that the bypass diode must be turned on before the internal circuit of the IC. Bypass diodes in the internal circuits of MOS linear regulators must have low forward voltage V_F . Some ICs are configured with current-limit thresholds to shut down high reverse current even when the output is off, allowing large leakage current from the diode to flow from the input to the output; therefore, it is necessary to choose one that has a small reverse current. Specifically, select a diode with a rated peak inverse voltage greater than the input to output voltage differential and rated forward current greater than the reverse current during use. When output voltage setting is 16 V and more, always connect reverse current bias diode.

Figure 22. Bypass Diode for Reverse Current Diversion

The lower forward voltage (V_F) of Schottky barrier diodes cater to requirements of MOS linear regulators, however the main drawback is found in the level of their reverse current (I_R), which is relatively high. So, one with a low reverse current is recommended when choosing a Schottky diode. The V_R - I_R characteristics versus temperatures show increases at higher temperatures.

2. Protection against Input Reverse Voltage

Accidental reverse polarity at the input connection flows a large current to the diode for electrostatic breakdown protection between the input pin of the IC and the GND pin, which may destroy the IC (see Figure 23).

A Schottky barrier diode or rectifier diode connected in series with the power supply as shown in Figure 24. is the simplest solution to prevent this from happening. The solution, however, is unsuitable for a circuit powered by batteries because there is a power loss calculated as $V_F \times I_{OUT}$, as the forward voltage V_F of the diode drops in a correct connection. The lower V_F of a Schottky barrier diode than that of a rectifier diode gives a slightly smaller power loss. Because diodes generate heat, care must be taken to select a diode that has enough allowance in power dissipation. A reverse connection allows a negligible reverse current to flow in the diode.

Figure 23. Current Path in Reverse Input Connection

Figure 24. Protection against Reverse Polarity 1

Figure 25 shows a circuit in which a P-channel MOSFET is connected in series with the power. The diode located in the drain-source junction portion of the MOSFET is a body diode (parasitic element). The voltage drop in a correct connection is calculated by multiplying the resistance of the MOSFET being turned on by the output current I_{OUT} , therefore it is smaller than the voltage drop by the diode (see Figure 24) and results in less of a power loss. No current flows in a reverse connection where the MOSFET remains off.

If the voltage taking account of derating is greater than the voltage rating of MOSFET gate-source junction, lower the gate-source junction voltage by connecting voltage dividing resistors as shown in Figure 26.

Figure 25. Protection against Reverse Polarity 2

Figure 26. Protection against Reverse Polarity 3

Linear Regulators Reverse Voltage Protection - continued

3. Protection against Output Reverse Voltage when Output Connect to an Inductor

If the output load is inductive, electrical energy accumulated in the inductive load is released to the ground upon the output voltage turning off. In-between the IC output and ground pins are a diode for preventing electrostatic breakdown, in which large current flows that could destroy the IC. To prevent this from happening, connect a Schottky barrier diode in parallel with the diode (see Figure 27).

Further, if a long wire is in use for the connection between the output pin of the IC and the load, observe the waveform on an oscilloscope, since it is possible that the load becomes inductive. An additional diode is needed for a motor load that is affected by its counter electromotive force, as it produces an electrical current in a similar way.

Figure 27. Current Path in Inductive Load (Output: Off)

Thermal Design

Figure 28. Power Dissipation

IC mounted on ROHM standard board based on JEDEC.

(1): 1 - layer PCB
 (Copper foil area on the reverse side of PCB: 0 mm x 0 mm)
 Board material: FR4
 Board size: 114.3 mm x 76.2 mm x 1.57 mmt
 Mount condition: PCB and exposed pad are soldered.
 Top copper foil: ROHM recommended footprint + wiring to measure, 2 oz. copper.

(2): 4 - layer PCB
 (2 inner layers and Copper foil area on the reverse side of PCB: 74.2 mm x 74.2 mm)
 Board material: FR4
 Board size: 114.3 mm x 76.2 mm x 1.60 mmt
 Mount condition: PCB and exposed pad are soldered.
 Top copper foil: ROHM recommended footprint + wiring to measure, 2 oz. copper.
 2 inner layers copper foil area of PCB : 74.2 mm x 74.2 mm, 1 oz. copper.
 Copper foil area on the reverse side of PCB : 74.2 mm x 74.2 mm, 2 oz. copper.

Condition (1): $\theta_{JA} = 119.3 \text{ }^\circ\text{C/W}$, $\Psi_{JT}(\text{top}) = 8 \text{ }^\circ\text{C/W}$
 Condition (2): $\theta_{JA} = 22.0 \text{ }^\circ\text{C/W}$, $\Psi_{JT}(\text{top}) = 3 \text{ }^\circ\text{C/W}$

When operating at temperature more than $T_a = 25 \text{ }^\circ\text{C}$, please refer to the power dissipation characteristic curve shown in Figure 28.

The IC characteristics are closely related to the temperature at which the IC is used, so it is necessary to operate the IC at temperatures less than the maximum junction temperature T_{jmax} .

Figure 28 show the acceptable power dissipation characteristic curves of the HRP5 package. Even when the ambient temperature (T_a) is at normal temperature ($25 \text{ }^\circ\text{C}$), the chip junction temperature (T_j) may be quite high so please operate the IC at temperatures less than the acceptable power dissipation.

The calculation method for power consumption P_c (W) is as follows

$$P_c = (V_{cc} - V_o) \times I_o + V_{cc} \times I_b$$

Acceptable loss $P_d \geq P_c$

Solving this for load current I_o in order to operate within the acceptable loss

$$I_o \leq \frac{P_d - V_{cc} \times I_b}{V_{cc} - V_o}$$

V_{cc} is Input voltage.

V_o is Output voltage.

I_o is Load current.

I_b is Circuit current.

It is then possible to find the maximum load current I_{omax} with respect to the applied voltage V_{cc} at the time of thermal design.

Calculation Example) When HRP5, $T_a = 85 \text{ }^\circ\text{C}$, $V_{cc} = 13.5 \text{ V}$, $V_o = 5.0 \text{ V}$

$$I_o \leq \frac{2.953 - 13.5 \times I_b}{8.5}$$

(Figure 28. (2) $\theta_{ja} = 22 \text{ }^\circ\text{C/W} \rightarrow -45.5 \text{ mW}/^\circ\text{C}$
 $25 \text{ }^\circ\text{C} = 5.68 \text{ W} \rightarrow 85 \text{ }^\circ\text{C} = 2.953 \text{ W}$)

$$I_o \leq 346.5 \text{ [mA]} \text{ (} I_b: 0.58 \text{ mA)}$$

Please refer to the above information and keep thermal designs within the scope of acceptable loss for all operating temperature ranges.

I/O Equivalence Circuits

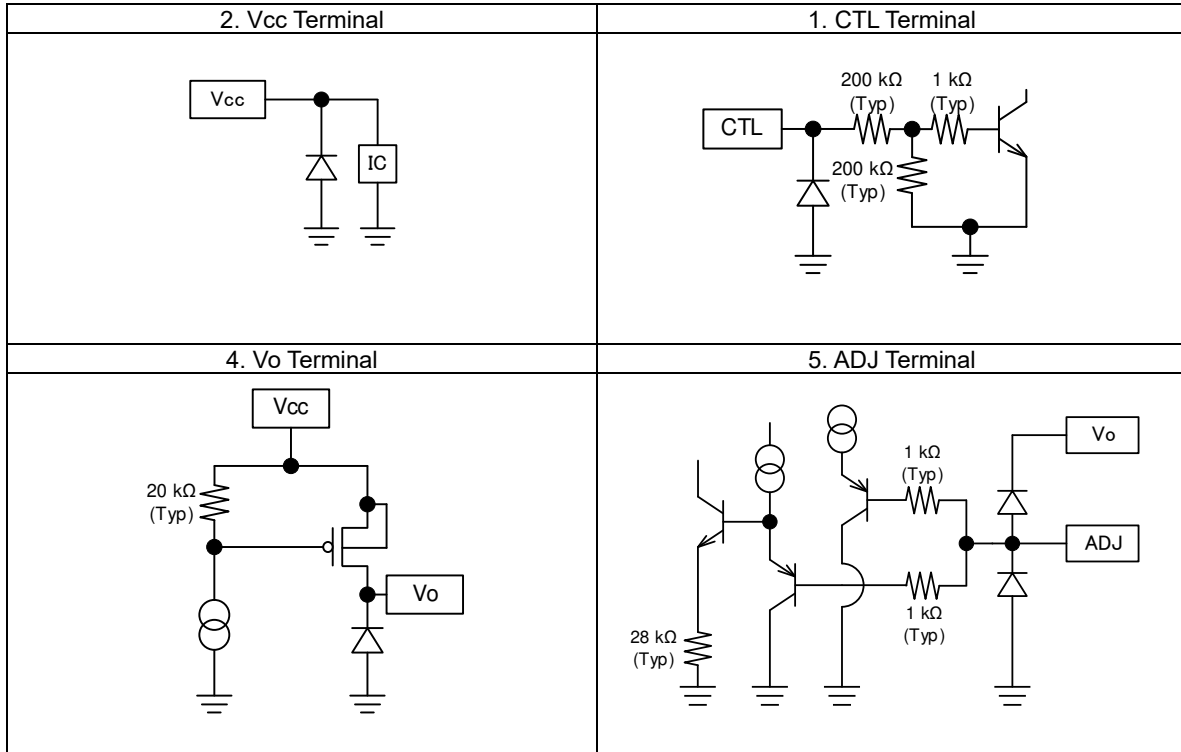

Figure 29. I/O equivalence circuit

Output Voltage Configuration Method

Please connect resistors R₁ and R₂ (which determines the output voltage) as shown in Figure 30.

Please be aware that the offset due to the current that flows from the ADJ terminal becomes large when resistor values are large. Due to this, resistance ranging from 5 kΩ to 10 kΩ is highly recommended for R₁.

$$V_o \approx ADJ \times \frac{(R_1 + R_2)}{R_1}$$

Figure 30. Output Voltage Configuration

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Recommended Operating Conditions

The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

6. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

7. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

8. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

9. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

Operational Notes – continued

10. Regarding the Input Pin of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

- When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
- When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

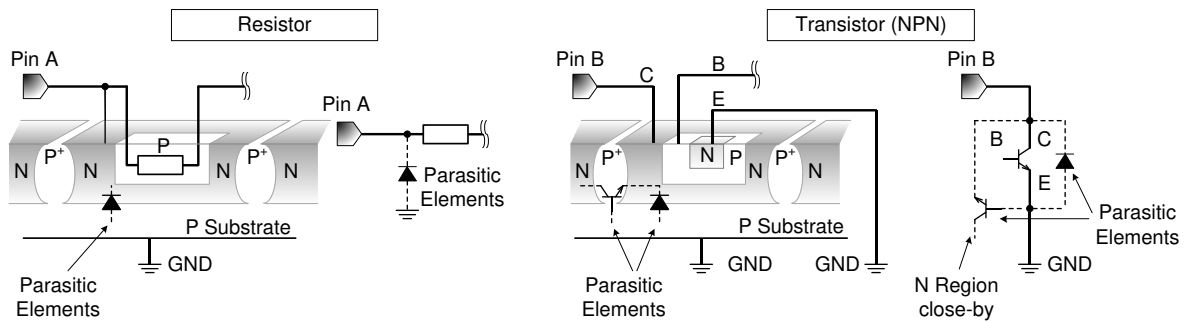

Figure 31. Example of Monolithic IC Structure

11. Ceramic Capacitor

When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

12. Thermal Shutdown Circuit (TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF power output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

13. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

14. Vcc Pin

Insert a capacitor (Vo ≥ 5.0 V: capacitor ≥ 1 μF, 1.5 V < Vo ≤ 5.0 V: capacitor ≥ 2.2 μF) between the Vcc and GND pins. Choose the capacitance according to the line between the power smoothing circuit and the Vcc pin. Selection of the capacitance also depends on the application. Verify the application and allow for sufficient margins in the design. We recommend using a capacitor with excellent voltage and temperature characteristics.

Figure 32. Input Capacitor

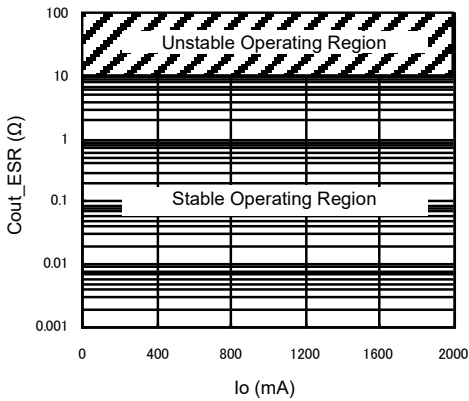

Operational Notes – continued

15. Output Pin

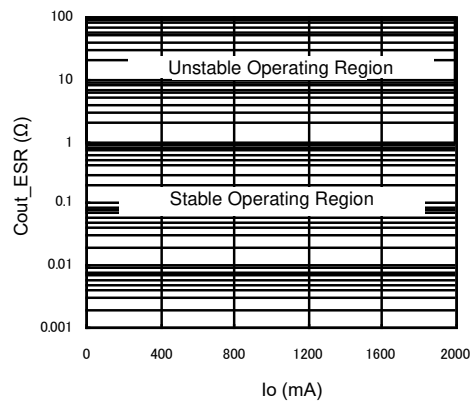

In order to prevent oscillation, a capacitor needs to be placed between the output pin and GND pin. We recommend a capacitor with a capacitance of more than 2.2 μF (Min) (3.0 V ≤ Vo). Electrolytic, tantalum and ceramic capacitors can be used. We recommend a capacitor with a capacitance of more than 4.7 μF (Min) (1.5 V ≤ Vo < 3.0 V). Ceramic capacitors can be used. When selecting the capacitor ensure that the capacitance of more than 2.2 μF (Min) (3.0 V ≤ Vo) or more than 4.7 μF (Min) (1.5 V ≤ Vo < 3.0 V) is maintained at the intended applied voltage and temperature range. Due to changes in temperature, the capacitance can fluctuate possibly resulting in oscillation. For selection of the capacitor refer to the Cout ESR vs Io data. The stable operation range given in the reference data is based on the standalone IC and resistive load. For actual applications the stable operating range is influenced by the PCB impedance, input supply impedance and load impedance. Therefore verification of the final operating environment is needed. When selecting a ceramic type capacitor, we recommend using X5R, X7R or better with excellent temperature and DC-biasing characteristics and high voltage tolerance. Also, in case of rapidly changing input voltage and load current, select the capacitance in accordance with verifying that the actual application meets with the required specification.

4.0 V ≤ Vcc ≤ 32.0 V

 -40 °C ≤ Ta ≤ +105 °C
 5 kΩ ≤ R1 ≤ 10 kΩ
 2.2 μF ≤ Cin ≤ 100 μF
 4.7 μF ≤ Cout ≤ 100 μF

Cout ESR vs Io
 3.0 V ≤ Vo ≤ 30.0 V

Cout ESR vs Io
 1.5 V ≤ Vo < 3.0 V

Measurement Circuit

Operational Notes – continued**16. CTL Pin**

Do not set the voltage level on the IC's enable pin in between V_{thH} and V_{thL} . Do not leave it floating or unconnected, otherwise, the output voltage would be unstable.

17. Rapid variation in Vcc Voltage and load Current

In case of a rapidly changing input voltage, transients in the output voltage might occur due to the use of a MOSFET as output transistor. Although the actual application might be the cause of the transients, the IC input voltage, output current and temperature are also possible causes. In case problems arise within the actual operating range, use countermeasures such as adjusting the output capacitance.

18. Minute variation in output voltage

In case of using an application susceptible to minute changes to the output voltage due to noise, changes in input voltage and load current, etc., use countermeasures such as implementing filters.

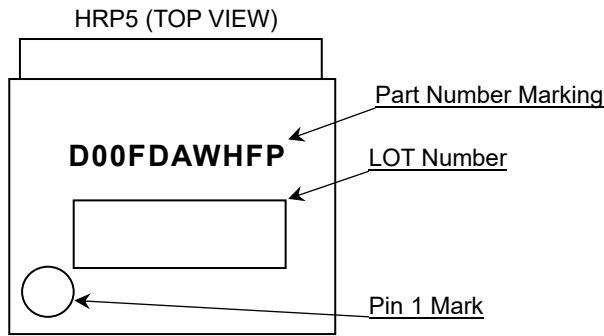

19. Regarding the Input Pin and Vcc voltage

In some applications, the Vcc and pin potential might be reversed, possibly resulting in circuit internal damage or damage to the elements. For example, while the external capacitor is charged, the Vcc shorts to the GND. Use a capacitor with a capacitance with less than 1000 μF . We also recommend using reverse polarity diodes in series or a bypass between all pins and the Vcc pin.

Ordering Information

Marking Diagram

Physical Dimension and Packing Information

Package Name	HRP5
--------------	------

(UNIT ; mm)
 PKG : HRP5
 Drawing No. EX541-5002-2

< Tape and Reel Information >

Tape	Embossed carrier tape
Quantity	2000pcs
Direction of feed	TR The direction is the pin 1 of product is at the upper right when you hold reel on the left hand and you pull out the tape on the right hand

Revision History

Date	Revision	Changes
11.May.2021	001	New Release
16.May.2022	002	P.15 Correction of Vout calculation formula errors

Notice

Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - Installation of protection circuits or other protective devices to improve system safety
 - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
 - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - Sealing or coating our Products with resin or other coating materials
 - Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.) ; or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
