

Tsi568A[™] Serial RapidIO® Switch

INTERFACE & CONNECTIVITY | CLOCKS & TIMING

FEATURES

Serial RapidIO Interfaces

- Bandwidth of up to 80 Gbps full duplex
- · Low latency with cut-through capability
- Individual port power down
- RapidIO Interconnect Specification (Revision 1.2) compliant

The Tsi568A enhances system scalability through device configuration and provides architects and designers with a solution for both throughput intensive and power sensitive applications.

- Port flexibility for multiple I/O bandwidth requirements:
- Up to eight 4x mode ports or sixteen 1x mode ports
- Each 4x serial port can be configured as two 1x serial ports
- Integrated high-speed, full-duplex SerDes with 8b/10b encoding
- Advanced non-blocking internal switching fabric
- Specifically designed for line rate termination and prevention of head-of-line blocking
- Port SerDes frequency configuration to 1.25,
 2.5, and 3.125 Gbits/s
- Look-up tables: Flat addressing of destination IDs

Other Device Capabilities

- I²C Interface: Configuration through register initialization
- Hot Swappable ports: Enables use in field replaceable blade applications

Device Overview

The IDT Tsi568A is an industry leading Serial RapidIO switch supporting 80 Gbps aggregate bandwidth. The Tsi568A is part of a family of switches that enable customers to develop systems with robust features and high performance at low cost.

The Tsi568A provides designers and architects with maximum scalability to design the device into a wide range of applications. Flexible port configurations can be selected through multiple port width and frequency options.

Based on the *Serial RapidIO Specification*, the Tsi568A incorporates SerDes functionality, error recovery, priority-based fabric routing, high payload efficiency, and table-based fabric packet routing. In addition, the Tsi568A supports RapidFabric extensions including data streaming packet switching for interworking and encapsulation.

The device goes beyond standard specification requirements to solve system level issues by optimizing performance, lowering power consumption, and supporting hot swappable I/Os. The extensive buffering and traffic management architecture is specifically designed for line rate termination and the prevention of head-of-line blocking.

Tsi568A™ Serial RapidIO Switch

BENEFITS

- Scalability: device variations of port width and frequencies
- Performance: low latency and high protocol efficiency
- Power: low power implementation of integrated SerDes functionality
- Time-to-market: leverages open-standard technology

Specifications

- Technology: 0.13um
- Voltage: 1.2V and 3.3V
- Low power consumption
 - Highly configuration dependent with SerDes voltage range, baud rate, and port width impacting power consumption
- Package: 675 ball, 27mm x 27mm, 1mm ball pitch FCBGA

Target Markets

- Wireless Embedded Communications
 - Node B, Radio Network Controller,
 Media Gateway
- Access Embedded Communications
 - Multiservice WAN Switches, 1 to 10 Gbit Ethernet Switches, 1 to >10 Gbit Routers, DSLAMs
- Storage
 - Storage Area Networks,
 Network Attached Storage,
 High-Performance Work Stations

Typical Applications

The Tsi568A can be used in many embedded communication applications. It provides chip-to-chip interconnect between I/O devices and can replace existing proprietary backplane fabrics for board-to-board interconnect which improves system cost and product time-to-market.

The Tsi568A provides traffic aggregation through packet prioritization when it is used with RapidIO-enabled I/O devices. When it is in a system with multiple RapidIO-enabled processors it provides high performance peer-to-peer communication through its non-blocking switch fabric.
