## High-Speed CMOS Logic

The RCA-CD54/74HC4049 and CD54/74HC4050 are fabricated with high-speed silicon gate technology. They have a modified input protection structure that enables these parts to be used as logic level translators which will convert high-level logic to a low-level logic while operating off the low-level logic supply. For example, 0-V to 15-V input logic levels can be down-converted to 0-V to 5-V logic levels. The modified input protection structure protects the input from both positive and negative electrostatic discharge. These parts can also be used as simple buffers or inverters without level translation. The CD54/74HC4049 and CD54/74HC4050 are enhanced versions of equivalent CMOS types.

The CD54HC4049 and CD54/74HC4050 are supplied in 16-lead hermetic dual-in-line ceramic packages (F suffix) and in 16-lead dual-in-line plastic packages (E suffix) and in 16-lead dual-in-line surface mount plastic packages (M suffix). Both types are also available in chip form (H suffix).
