

Overview

The KEMET EC2/EE2 miniature signal relays offer a compact case size in a slim package. Minimal board space is consumed with either a through-hole or surface mount configuration. These relays are recognized by UL and CSA, while also being compliant with Part 68 of the FCC's 1,500 V surge capacity.

Applications

- Electronic switching systems
- PBX
- Terminal equipment
- Telephone systems

Benefits

- Low power consumption (< 200 mW)
- Compact and lightweight
- Low magnetic interference
- Tube or embossed tape and reel packaging
- UL recognized (E73266) and CSA certified (LR46266)
- Surface mount and through-hole options
- High Insulation (ND) type conforms to TUV EN60950 supplementary insulation class standards
- High Breakdown Voltage (NKX) type can withstand 1.5 kVAC at open contacts

Soldering Process

EC2 – Through-hole Mounting

Automatic Soldering

Preheating: 110–120°C / 110 seconds (maximum)

Solder temperature: 260°C maximum

Solder time: 5 seconds maximum

Note: KEMET recommends cooling down a printed circuit board to less than 110°C within 40 seconds after soldering.

Manual Soldering

Solder temperature: 350°C maximum

Solder time: 3 seconds maximum

EE2 – Surface Mounting

IRS Method

Note:

Temperature profile shows printed circuit board surface temperature on the relay terminal portion.

Please consult KEMET if you wish to use a temperature profile other than above.

Contact Specifications

| Item | | EC2/EE2 |
|-----------------------------------|--|---|
| Contact Form | | 2 Form C |
| Contact Material | | Silver alloy with gold alloy overlay |
| Contact Ratings | Maximum Switching Power | 60 W, 125 VA |
| | Maximum Switching Voltage | 220 VDC, 250 VAC |
| | Maximum Switching Current | 2 A |
| | Maximum Carrying Current | 2 A |
| Minimum Contact Ratings | | 10 mVDC, 10 μ A ¹ |
| Initial Contact Resistance | | 75 m Ω maximum (initial) |
| Operating Time (excluding bounce) | | Approximately 2 milliseconds |
| Release Time (excluding bounce) | | Approximately 1 millisecond |
| Insulation Resistance | | 1,000 M Ω @ 500 VDC |
| Withstand Voltage | Between Open Contacts | NU, NJ, ND, NUH, NUX: 1,000 VAC (for one minute), 1,500 V surge (10 x 160 μ s) ² |
| | | NKX: Make contact: 1,500 VAC (for one minute), 2,500 V surge (2 x 10 μ s) ³ Break contact: 1,000 VAC (for one minute), 1,500 V surge (10 x 160 μ s) ² |
| | Between Adjacent Contacts | 1,000 VAC (for one minute), 1,500 V surge (10 x 160 μ s) ² |
| Between Coil and Contacts | Non-latch and single coil latch type: 1,500 VAC (for one minute), 2,500 V surge (2 x 10 μ s) ³ | |
| | Double coil latch type: 1,000 VAC (for one minute), 1,500 V surge (10 x 160 μ s) ² | |
| Shock Resistance | | 735 m/s ² (75 G) – misoperation 980 m/s ² (100 G) – destructive failure |
| Vibration Resistance | | 10 to 55 Hz, double amplitude 3 mm (20 G) – misoperation 10 to 55 Hz, double amplitude 5 mm (30 G) – destructive failure |
| Ambient Temperature | | -40 to +85°C |
| Coil Temperature Rise | | 18°C at nominal coil voltage (140 mW) |
| Running Specifications | Non-load | 1 x 10 ⁸ operations (Non-latch type) ⁴ 1 x 10 ⁷ operations (Latch type) |
| | Load | 50 VDC 0.1 A (resistive), 1 x 10 ⁶ operations @ 85°C, 5 Hz 10 VDC 10 mA (resistive), 1 x 10 ⁶ operations @ 85°C, 2 Hz |
| Weight | | Approximately 1.9 g |

¹ This value is a reference value in the resistance load. Minimum capacity changes depending on the switching frequency, environment temperature, and load.

² Rise time: 10 μ s; decay time to half crest: 160 μ s.

³ Rise time: 2 μ s; decay time to half crest: 10 μ s.

⁴ This shows the number of operations with fatal defects. Stable characteristics are maintained for 1 x 10⁷ operations.

Coil Specifications

| Non-latch Type (@ 20°C) | | | | |
|----------------------------|--------------------------|--------------------------------------|------------------------------------|------------------------------|
| Nominal Coil Voltage (VDC) | Coil Resistance (Ω) ±10% | Operating Voltage ¹ (VDC) | Release Voltage ¹ (VDC) | Nominal Operating Power (mW) |
| 3 | 64.3 | 2.25 | 0.3 | 140 |
| 4.5 | 145 | 3.38 | 0.45 | 140 |

Relay Direction Mark and Tape Carrying Direction

Notes on Using Relays

1. Contact Load

Make sure that the contact load is within the specified range; otherwise, the lifetime of the contacts will be shortened considerably. Note that the running performance shown is an example, and that it varies depending on parameters such as the type of load, switching frequency, driver circuit, and ambient temperature under the actual operating conditions.

2. Driving Relays

- If the internal connection diagram of a relay shows + and - symbols on the coil, apply the rated voltage to the relay in the specified direction. If a rippled DC current source is used, abnormalities such as heat at the coil may occur.
- The maximum voltage that can be applied to the coil of the relay varies depending on the ambient temperature. Generally, the higher the voltage applied to the coil, the shorter the operating time. Note, however, that high voltage also increases the bounce of the contacts and the contact opening and closing frequency, which may shorten the lifetime of the contacts.
- For consistent operation, the driving voltage should have rise and fall times of less than 1 ms.

- For a latching relay, apply a voltage to the coil according to the polarity specified in the internal connection diagram of the relay.
- If a current is applied to the coil over a long period of time, the coil temperature rises, promoting generation of organic gas inside the relay, which may result in faulty contacts. In this case, use of a latching relay is recommended.
- The operating time and release time indicate the time required for each contact to close after the voltage has been applied to or removed from the coil. However, because the relay has a mechanical structure, a bounce state exists at the end of the operating and release times. Furthermore, because additional time is required until the contact stabilizes after being in a high-resistance state, care must be taken when using the relay at high speeds.

3. Operating Environment

- Make sure that the relay mounted in the application set is used within the specified temperature range. Use of a relay at a temperature outside this range may adversely affect insulation or contact performance.
- If the relay is used for a long period of time in highly humid (RH 85% or higher) environment, moisture may be absorbed into the relay. This moisture may react with the NO_x and SO_x generated by glow discharges that occur when the contacts are opened or closed, producing nitric or sulfuric acid. If this happens, the acid produced may corrode the metallic parts of the relay, causing operational malfunction.
- If any material containing silicon (silicon rubber, silicon oil, and silicon based coating material) is used in the neighborhood of relay, there is some possibility that these materials will emit silicon gas that will penetrate the relay. In this case, the switching contact may generate silicon compounds on the surface of contacts. This silicon compound may result in contact failure. Avoid use of relay in such an environment.

Notes on Using Relays cont'd

- Because the operating temperature range varies depending on the humidity, use the relay in the temperature range illustrated in the figure below. Prevent the relay from being frozen and avoid the generation of condensation.

- The relay maintains constant sealability under normal atmospheric pressure (810 to 1,200 hpa). Its sealability may be degraded or the relay may be deformed and malfunction if it is used under barometric conditions exceeding the specified range.
- The same applies when the relay is stored or transported. Keep the upper-limit value of the temperature to which the relay is exposed after it is removed from the carton box to within 50°C.
- Permanent magnets are used in polarized relays. For this reason, when magnets, transformers, or speakers are located nearby the relay characteristics may change and faulty operations may result.
- If excessive vibration or shock is applied to the relay, it may malfunction and the contacts remain closed. Vibration or shock applied to the relay during operation may cause considerable damage to or wearing of the contacts. Note that operation of a snap switch mounted close to the relay or shock due to the operation of magnetic solenoid may also cause malfunctioning.

4. Mounting

- When mounting a relay onto a PC board using an automatic chip moulder, if excessive force is applied to the cover of the relay when the relay is chucked or inserted, the cover may be damaged or the characteristics of the relay degraded. Keep the force applied to the relay to within 1 kg.
- Avoid bending the pins to temporarily secure the relay to the PC board. Bending the pins may degrade sealability or adversely affect the internal mechanism.
- Ventilation immediately after soldering is recommended. Avoid immersing the relay in cleaning solvent immediately after soldering due to the danger of thermal shock being applied to the relay.
- Use an alcohol-based or water-based cleaning solvent. Never use thinner and benzene because they may damage the relay housing.
- Do not use ultrasonic cleaning because the vibration energy generated by the ultrasonic waves may cause the contacts to remain closed.

5. Handling and Storage

- Relays are packaged in magazine cases for shipment. If a space is created in the case after some relays have been removed, be sure to insert a stopper to secure the remaining relays in the case. If relays are not well secured, vibration during transportation may cause malfunctioning of the contacts.
- Exercise care in handling the relay so as to avoid dropping it or allowing it to fall. Do not use a relay that has been dropped. If a relay drops from a workbench to the floor, a shock of 9,800 m/s² (1,000 G) or more is applied to the relay, possibly damaging its functions. Even if a light shock has been applied to the relay, thoroughly evaluate its operation before using it.

Notes on Using Relays cont'd

- Latching relays are factory-set to reset state for shipment. A latching relay may be set, however, by vibration or shock applied while being transported. Be sure to forcibly reset the relay before using it in the application set. Also note that the relay may be set by unexpected vibration or shock when it is used in a portable set.
- The sealability of a surface mount (SMT) relay may be lost if the relay absorbs and is then heated during soldering. When storing relays, therefore, observe the following points:
 1. For standard packing, please use relays within 12 months after delivery (storage conditions: 30°C / 60% RH). If the relays have moisture absorption, dehumidify as follows:
 - Tape Packaging: 50 ±5°C, 200–300 hours.
 - Simple Relay: 85 ±5°C, 48 hours.
 2. For MBB packing, please use relays within 2 years after delivery (storage conditions: 30°C / 60% RH). After opening MBB packing, please use within 3 months (storage conditions: 30°C / 60% RH).

Disclaimer

This product has been made available through a Private Label Agreement and a Development and Cross-Licensing Agreement between KEMET and NEC TOKIN to expand market and product offerings for both companies and their respective customers. For more information, please visit <http://www.kemet.com/nectokin>.

All product specifications, statements, information and data (collectively, the "Information") in this datasheet are subject to change. The customer is responsible for checking and verifying the extent to which the Information contained in this publication is applicable to an order at the time the order is placed.

All Information given herein is believed to be accurate and reliable, but it is presented without guarantee, warranty, or responsibility of any kind, expressed or implied.

Statements of suitability for certain applications are based on KEMET Electronics Corporation's ("KEMET") knowledge of typical operating conditions for such applications, but are not intended to constitute – and KEMET specifically disclaims – any warranty concerning suitability for a specific customer application or use. The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by KEMET with reference to the use of KEMET's products is given gratis, and KEMET assumes no obligation or liability for the advice given or results obtained.

Although KEMET designs and manufactures its products to the most stringent quality and safety standards, given the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage.

Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicated or that other measures may not be required.
