

FEATURES

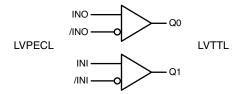

- 3.3V power supply
- 1.9ns typical propagation delay
- Maximum frequency > 275MHz
- **■** Differential LVPECL inputs
- 24mA LVTTL outputs
- **■** Flow-through pinouts
- Internal input resistors: pull-down on IN, pull-down and pull-up on /IN
- Q output will default LOW with inputs open
- Available in ultra-small 8-pin MLF[®] (2mm x 2mm) package

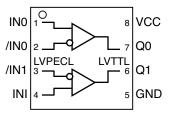

DESCRIPTION

The SY89323L is a dual differential LVPECL-to-LVTTL translator. Because LVPECL (Low Voltage Positive ECL) levels are used, only +3.3V and ground are required. The SY89323L is functionally equivalent to the SY100EPT23L, but in an ultra-small 8-pin MLF $^{\tiny (B)}$ package that features a 70% smaller footprint. The ultra-small package and the dual gate design of the SY89823L make it ideal for applications that require the translation of a clock and data signal in a minimal space. The inputs are compatible with 10k and 100k input levels and any standard differential LVPECL input referenced to a $V_{\rm CC}$ of 3.3V.

Ordering Information

Part Number	Package Type	Operating Range	Package Marking	Lead Finish
SY89323LMITR	MLF-8	Industrial	323	Sn-Pb
SY89323LMGTR ⁽¹⁾	MLF-8	Industrial	323 with Pb-Free bar-line indicator	Pb-Free NiPdAu

Note:

1. Pb-Free package is recommended for new designs.

Pin Number	Pin Name	Туре	Pin Function
1, 4	INO, IN1	ECL Input	Differential PECL/ECL Input: Internal 75kΩ pull-down resistor. If left open, pin defaults LOW. Q output will be LOW. See "Input Interface Applications" section for single-ended inputs.
2, 3	/IN0, /IN1	ECL Input	Differential PECL/ECL Input: Internal $75k\Omega$ pull-up and pull-down resistors. If left floating, pin defaults to $V_{CC}/2$. When not used, this input can be left open. See "Input Interface Applications" section for single-ended inputs.
7, 6	Q0, Q1	LVTTL Output	Single-ended LVTTL Outputs: Default to LOW if IN inputs left open.
8	VCC	VCC Power	Positive Power Supply: Bypass with 0.1μF//0.01μF low ESR capacitors.
5	GND, Exposed Pad	Ground	GND and exposed pad must be tied to ground plane.

Notes:

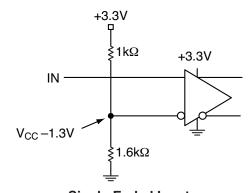

- 1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- 2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
- 3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.
- 4. V_{IHCMR} (min) varies 1:1 with V_{EE} , max varies 1:1 with V_{CC} .

 V_{CC} = +3.3V±10%; C_L = 20pF, T_A = -40°C to +85°C, unless otherwise noted. All parameters guaranteed by design and characterization.

Notes:

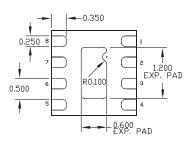

- 1. Frequency at which guaranteed for functionality. V_{OH} and V_{OL} levels are guaranteed at DC only.
- 2. The f_{MAX} value is specified as the minimum guaranteed maximum frequency. Actual operational maximum frequency may be greater.
- 3. Device-to-Device Skew considering HIGH-to-HIGH transitions at common V_{CC} level.
- 4. Within-Device Skew considering HIGH-to -HIGH transitions at common $V_{\mbox{\footnotesize{CC}}}$ level.
- 5. Within-Device Skew considering LOW-to-LOW transitions at common V_{CC} level.
- 6. Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles, T_n T_{n-1}, where T is the time between rising edges of the output signal.
- 7. Total jitter definition: with an ideal clock input of frequency ≤ f_{MAX}, no more than one output edge in 10¹² output edge will deviate by more than the specified peak-to-peak jitter value.
