## **Description**

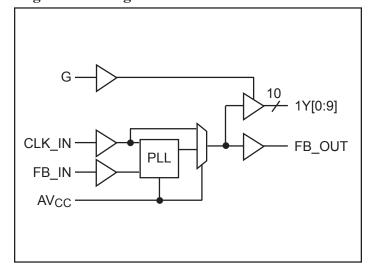

1

The PI6C2510A family is a low-skew, low-jitter, phase-lock loop (PLL) clock driver, distributing high-frequency clock signals for SDRAM and server applications. By connecting the feedback FB\_OUT output to the feedback FB\_IN input, the propagation delay from the CLK\_IN input to any clock output will be nearly zero. This zero-delay feature allows the CLK\_IN input clock to be distributed, providing one clock input to one bank of ten outputs, with an output enable.

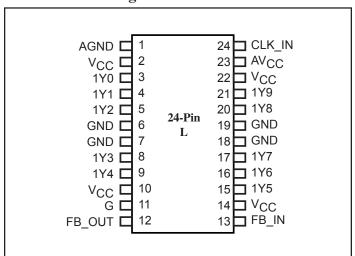

The PI6C2510A is designed to meet PC100 SDRAM Registered DIMM Specification, for heavy load applications. For test purposes, the PLL can be bypassed by strapping AV<sub>CC</sub> to ground.

The PI6C2510A family has the same pinouts as TI's CDC2510A/2510B, with enhanced rise/fall times, and allowing a Spread Spectrum clock input.

#### **Functional Table**

Inputs		Outputs		
G	CLK_IN	1Y[0:9]	FB_OUT	
X	L	L	L	
L	Н	L	Н	
Н	Н	Н	Н	

## **Pin Functions**

Pin Name	Pin No.	Туре	Description
CLK_IN	24	I	Reference Clock input. CLK_IN allows spread spectrum of 0.5% underspread.
FB_IN	13	I	Feedback input. FB_IN provides the feedback signal to the internal PLL
G	11	I	Output bank enable. When G is LOW, outputs 1Y[09] are disabled to a logic low state. When G is HIGH, all outputs 1Y[0:9] are enabled.
FB_OUT	12	О	Feedback output. FB_OUT is dedicated for external feedback. FB_OUT has an embedded series-damping resistor of the same value as the clock outputs 1Yx, 2Yx.
1Y[0:9]	3,4,5,8,9,15 16,17,20,21	O	Clock outputs. These outputs provide low-skew copies of CLK_IN.  Each output has an embedded series-damping resistor.
AV <sub>CC</sub>	23	Power	Analog power supply. AV <sub>CC</sub> can be also used to bypass the PLL for test purposes. When AV <sub>CC</sub> is strapped to ground, PLL is bypassed and CLK_IN is buffered directly to the device outputs.
AGND	1	Ground	Analog ground. AGND provides the ground reference for the analog circuitry.
V <sub>CC</sub>	2,10,14,22	Power	Power supply.
GND	6,7,18,19	Ground	Ground
