

15-V PROGRAMMABLE HOT SWAP POWER MANAGER

FEATURES

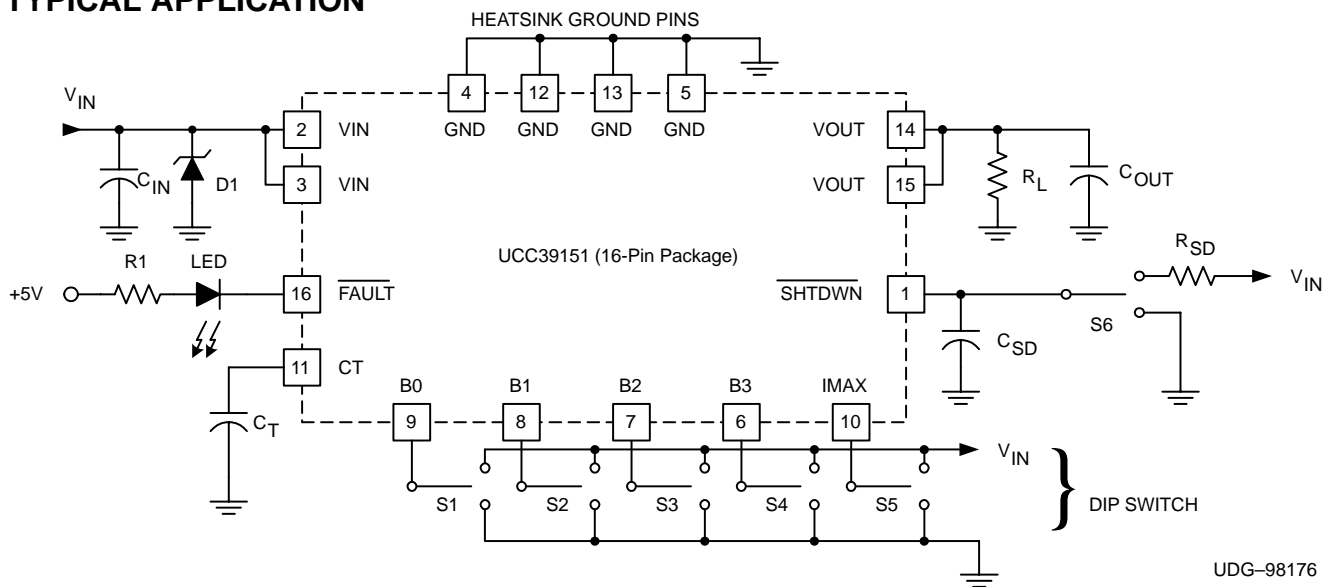

- Integrated 0.15-Ω Power MOSFET
- 7-V to 15-V Operation
- Digital Programmable Current Limit from 0 A to 3 A
- Programmable On-Time
- Programmable Start Delay
- Fixed 2% Duty Cycle
- Thermal Shutdown
- Fault Output Indicator
- Power SOIC and TSSOP, Low Thermal-Resistance Packaging

DESCRIPTION

The UCC39151 programmable hot swap power manager provides complete power management, hot swap capability, and circuit breaker functions. The only external component required to operate the device, other than power supply bypassing, is the fault timing capacitor, C_T . All control and housekeeping functions are integrated, and externally programmable. These include the fault current level, maximum output sourcing current, maximum fault time, and start-up delay. In the event of a constant fault, the internal fixed 2% duty cycle ratio limits average output power.

The internal 4-bit DAC allows programming of the fault level current from 0 A to 3 A with 0.25 A resolution. The IMAX control pin sets the maximum sourcing current to 1 A above the trip level or to a full 4 A of output current for fast output capacitor charging.

TYPICAL APPLICATION

UDG-98176

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

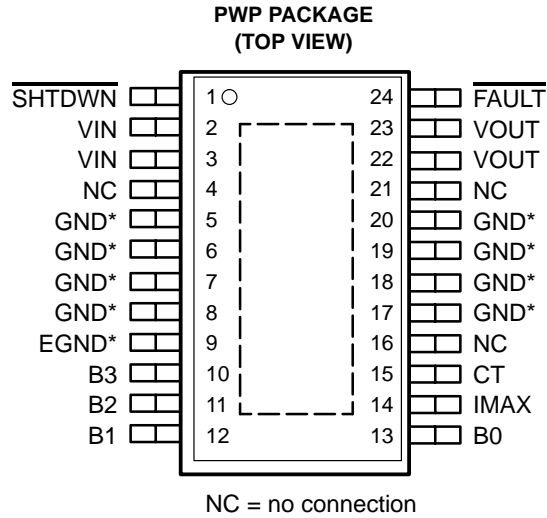

description (continued)

When the output current is below the fault level, the output MOSFET is switched on with a nominal on-resistance of 0.15 Ω. When the output current exceeds the fault level, but is less than the maximum sourcing level, the output remains switched on but the fault timer starts, charging C_T. Once C_T charges to a preset threshold, the switch is turned off, and remains off for 50 times the programmed fault time. When the output current reaches the maximum sourcing level, the MOSFET transitions from a switch to a constant current source.

absolute maximum ratings†

Input voltage, V _{IN}	15.5 V
(V _{OUT} – V _{IN})	0.3 V
FAULT sink current	50 mA
FAULT voltage	–0.3 to 8 V
Output current, V _{OUT}	Self limiting
TTL input voltage	–0.3 to V _{IN}
Storage temperature	–65°C to 150°C
Junction temperature	–55°C to 150°C
Lead temperature (soldering 10 seconds)	300°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. Currents are positive into, negative out of the specified terminal.

* Pin 5 on the N and DP packages (and pin 9 on the PWP package) serves as the lowest impedance to the electrical ground. Pins 4, 12 and 13 on the DP package (and pins 5, 6, 7, 8, 17, 18, 19, and 20 on the PWP package) serve as heatsink/ground. These pins should be connected to large etch areas to help dissipate heat. On the N package, pins 4, 12 and 13 are not connected.

AVAILABLE OPTIONS

T _A	PACKAGES		
	SOIC (DP)†	DIL (N)	TSSOP (PWP)†
0°C to 70°C	UCC39151DP	UCC39151N	UCC39151PWP

† The DP and PWP packages are available taped and reeled. Add TR suffix to device type (e.g. UCC39151DPTR) to order quantities of 2500 (DP) or 2000 (PWP) devices per reel.

Terminal Functions

TERMINAL				I/O	DESCRIPTION
NAME	PACKAGE				
	DP	N	PWP		
B0	9	9	13	I	Provides digital input to the DAC, which sets the fault current threshold. These can be used to provide a digital soft-start and adaptive current limiting.
B1	8	8	12	I	
B2	7	7	11	I	
B3	6	6	10	I	
CT	11	11	15	I/O	Capacitor connects to ground and sets the maximum fault time.
EGND	5	5	9	–	Serves as lowest impedance to the electrical ground.
$\overline{\text{FAULT}}$	16	16	24	O	Open-drain output, which pulls low upon any fault or interrupt condition, or thermal shutdown.
GND	4, 12, 13	–	5, 6, 7, 8, 17, 18, 19, 20	–	Heat sink/ground pins. These pins should be connected to large etch areas to help dissipate heat.
IMAX	10	10	14	I	When this pin is set low, the maximum sourcing current is 1 A above the programmed fault level. When set high, the maximum sourcing current is a constant 4 A for applications which require fast charging of load capacitance.
$\overline{\text{SHTDWN}}$	1	1	1	I	When this pin is brought low, the device is put into a sleep mode drawing typically less than 100 μA of I_{CC} (with VOUT unloaded). The input threshold is hysteretic, allowing the user to program a start-up delay with an external RC circuit.
VIN	2, 3	2, 3	2, 3	I	Input voltage. The recommended voltage range is 7 V to 15 V. Both VIN pins should be connected together and connected to power source.
VOUT	14, 15	14, 15	22, 23	O	Output voltage. VOUT must not exceed VIN by more than 0.3 V.

detailed pin descriptions

CT: A capacitor connected to ground sets the maximum fault time. The maximum fault time must be more than the time required to charge the external capacitance in one cycle. The maximum fault time is defined as:

$$t_{\text{FAULT}} = 16.1 \times 10^3 \times C_T \quad (1)$$

Once the fault time is reached the output shuts down for a time given by:

$$t_{\text{SD}} = 833 \times 10^3 \times C_T \quad (2)$$

This equates to a 1.9% duty cycle.

VOUT: Output voltage from the UCC39151. Both VOUT pins should be connected together and connected to the load. When switched:

$$V_{\text{OUT}} \cong V_{\text{IN}} - (0.15 \Omega \times I_{\text{OUT}}) \quad (3)$$

VOUT must not exceed VIN by more than 0.3V.

APPLICATION INFORMATION

protecting the UCC39151 from voltage transients

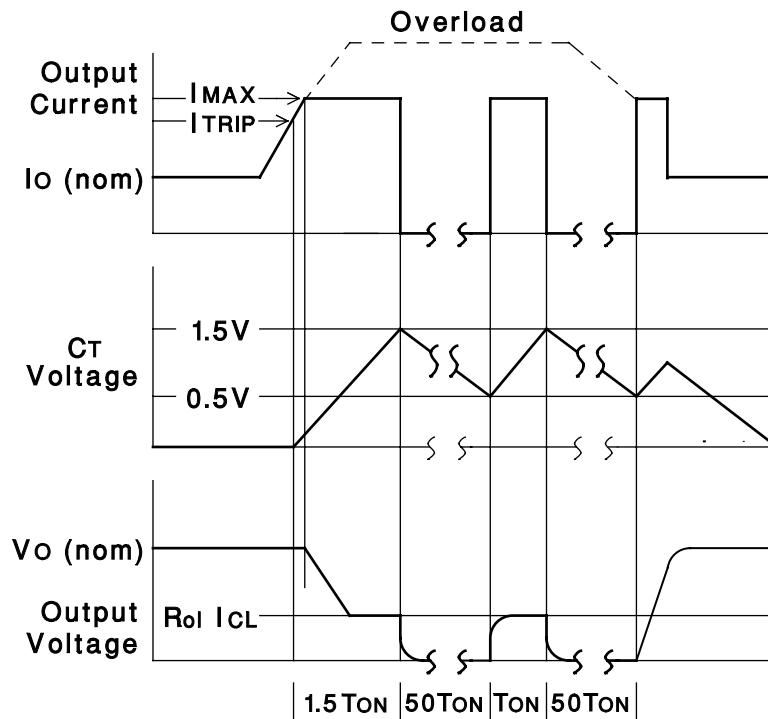

The parasitic inductance associated with the power distribution can cause a voltage spike at VIN if the load current is suddenly interrupted by the UCC39151. It is important to limit the peak of this spike to less than 15 V to prevent damage to the UCC39151. This voltage spike can be minimized by:

- Reducing the power distribution inductance (e.g., twist the positive (+) and negative (-) leads of the power supply feeding VIN, locate the power supply close to the UCC39151 or use PCB power and ground planes).
- Decoupling VIN with a capacitor, CIN (refer to Typical Application diagram), located close to the VIN pins. This capacitor is typically 1 μF or less to limit the inrush current.
- Clamping the voltage at VIN below 15 V with a Zener diode, D1 (refer to Typical Application diagram), located close to the VIN pins.

estimating maximum load capacitance

For hot swap applications, the rate at which the total output capacitance can be charged depends on the maximum output current available and the nature of the load. For a constant-current, current-limited application, the output comes up if the load asks for less than the maximum available short-circuit current.

To guarantee recovery of a duty-cycle from a short-circuited load condition, there is a maximum total output capacitance which can be charged for a given unit on-time (fault-time). The design value of on-time or fault-time can be adjusted by changing the timing capacitor CT.

UDG-94138

Figure 1. Output Waveforms Under Fault Conditions

APPLICATION INFORMATION

For worst-case constant-current load of value just less than the trip limit; $C_{OUT(max)}$ can be estimated from:

$$C_{OUT(max)} \approx (I_{MAX} - I_{LOAD}) \times \left(\frac{16.1 \times 10^3 \times C_T}{V_{OUT}} \right) \quad (4)$$

Where V_{OUT} is the output voltage.

For a resistive load of value R_L , the value of $C_{OUT(max)}$ can be estimated from:

$$C_{OUT(max)} \approx \left[\frac{16.1 \times 10^3 \times C_T}{R_L \times \ln \left(\frac{1}{1 - \frac{V_{OUT}}{I_{MAX} \times R_L}} \right)} \right] \quad (5)$$

Long C_T times must consider the maximum temperature. Thermal shutdown protection may be the limiting fault-time.

safety recommendations

Although the UCC39151 is designed to provide system protection for all fault conditions, all integrated circuits can ultimately fail short. For this reason, if the UCC39151 is intended for use in safety critical applications where UL or some other safety rating is required, a redundant safety device such as a fuse should be placed in series with the device. The UCC39151 prevents the fuse from blowing for virtually all fault conditions, increasing system reliability and reducing maintenance cost, in addition to providing the hot swap benefits of the device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
